> the same computers at $1000 more and not expecting a firestorm is the
> supreme act of arrogance, and the supreme definition of bonehead.

That 'bonehead' is more successfull than you are.. A genious that has
been able to launch new PB G3's, iMac DV's, G4 and OS 9 in five months
would have taken 'those boys' 20 years plus he has Pixar duty...

It's a moot point now. Will honor the previous clock speed... Get over
it!

If interoperability with a palm pilot is the issue, then
they can just use the publically available source code to
manage that task.

Free Software: because gloating about someone else not being
able to do something is not quite as useful as allowing
EVERYONE to do something.

[deletia]

This is why a UNIX is becoming more relevant than Steve's
'computer for the rest of us'.

The iMac suffers from the same problem any non-Windows98
configuration does. It's not percieved as the biggest
marketshare chunk by the people writing the drivers. Thus,
you see remarkably less vidcards or SCSI cards, PCI even,
that will boot on a Mac.

This is despite the fact that PCI is an open standard.

USB suffers similar effects any time a hardware vendor
strays outside of a standard USB hardware type (quite
often).

At this point, MacOS is in the same position as BeOS and Linux.

Looks like the sinclap random string generator is back.
Someone must have forgotten to update the sinclap internal
data reference libraries, though. G3 266 PowerBook? That's
old technology, G3 PowerBooks are at 400MHz now.

By the way, has anyone successfully run sinclap on a CT2?
I can't get it to run with the fast RAM flags switched on.
Is it allocating critical buffer space in the ST RAM address
range?

I'd love to see how much quicker sinclap can spew garbage
at the higher clock speed (does anyone have a Mac executable?
What spew-rate does it achieve on the new G4 processors?
I'm sure that's a much better performance metric than the
weedy signal processing libraries they took from Intel's
web site to prove its performance over the PIII)

I think our friend has missed the point. It isn't the ATARI we're talking
68000, it's the Dragonball-based Pilot. When sinclap uses his Palm IIIx,
he's using "yester-decade technology".

Nothing can be done due to the heavily encrypted security
algorithms in the sinclap random string generator. It will
post drivel anywhere and everywhere, you can't stop it or
protect yourself against it (yet). Let's just hope it suffers
Y2K syndrome and kicks the bucket come 2000.

At the moment, I have a top team of experts working around
the clock to develop a sinclap suppressor, which will only
work on Atari systems. With a 8MHz 68000, we can already
achieve overall 23% attenuation of the output spectrum, but
somewhere along the line we're getting a bus error on the
ST development system. Probably accessing an odd address at
some point. I'll re-compile it for the 68030 and see if the
same happens. We plan to open a web site soon, with all the
latest patches for you to download.

Substitute Mac for Atari...Sound similar? Except that Atari is not mainstream..

Mac advocates and misplaced zeal
10/21 - Rodney O. Lain

Leave these men alone! Let them go! For if their purpose or activity is of
human origin, it will fail. But if it is from God, you will not be able to stop
these men; you will only find yourselves fighting against God.

--Acts 5: 38-39

Q. What is the hardest thing you, as an evangelist, ever had to do?

A. Admit to myself that despite all the evangelism that I did, Microsoft
Windows was going to control the world.

--Guy Kawasaki

"Dear 'Guy' (I just realized that I don't even know your name - not the aformentioned Guy
Kawasaki),

"I don't like to offend people intentionally, but it seems I offended you anyway.

"You're a pretty likable by all accounts, and you don't really cause trouble in the store -- that I know
of. I'm sure that you read the Mac 'nets, so I want to be sure to say everything that I want to say
this time, since I was too busy to talk with you at length this weekend.

"You probably were surprised that I blew up at you the other day. It wasn't planned, and honestly,
I don't regret it.

"I didn't know any better way to say it; God, I don't even know if you heard everything that I said,
because therein was my biggest frustration expressed.

"Try to understand my position. I used to do the same things you do: I used to visit computer

stores and defend the Mac. I would literally sell computers to customers. I maintained the same siege mentality that you seem to be upholding. Today, however, a siege mentality is an anachronism for us Mac users -- it's no longer necessary. Like I did, you need to do some self-evaluation. Like I did, you need to see yourself as customers see you now: a person with misplaced zeal; a person who appears to have some Apple-lyptic mission to convert people by sheer force of will.

"This is how you are coming across.

"I wasn't going to say anything, but it became necessary. Nowadays, Apple Computer is a mainstream company that in many ways no longer needs us 'evangelists' to support the products and 'get the word out.' In the old days (which were not too long ago), Apple needed all the help it could get, since its management was ostensibly clueless.

"But, I hope you can see now that you don't need to devote as much time as you do now to hawking Mac wares in our store.

Please don't spend all day arguing with the Intel rep (that's my job :-). No, seriously, it just isn't professional, and I'd like to think that Apple would prefer if we Mac supporters would present a more mainstream image.
We do not need any sales help in the store. I do appreciate your zeal (sometimes I come across as a zealot in this column myself, so I can relate). On several occasions, I asked you if you'd like to apply for a job. I also asked you if you'd like to apply for a Demo Days' position.
You declined both times. Yet, you remain in the stores all day. Doesn't this seem a tad odd from a more objective standpoint?
You asked me if I meant everything that I said when I told you that I was tired of you being in the store. I said yes. I feel bad that I said it, but any other response would be a lie.

"These are painful things that need to be said. Many of them may be things that needed to be said to me in my most zealous moments.

"They need to be said, because Apple, Inc., and its Macintosh is entering a period of newfound celebrity. Customer satisfaction is high; public relations are a breeze.

More and more people are
switching to the Mac platform, in spite of the people who wish Apple
would dry up and die (yes,
believe it or not, there are people who will never use a Mac, due to bad
past experiences or due to
strong pro-Wintel preference) [1]. As for those who do buy Macs, though,
they will need outgoing
Mac users like you to help them make the transition.

"But what we need is a little more maturity than in times past. In the
past it was excusable,
because we were a persecuted minority. Every warm body was needed.
Today, the Mac is a viable
option; a mainstream choice.

"It's time we start acting like it."

The Mac is no more mainstream than anything else that
is not Windows 98. So, you're gloating really is not
at all justified. It's quite absurd really.

Sounds like sour grapes...Whats the matter...the underpowered and
overprriced Milan have not reached the shores yet?

Looks like the iMac is indeed a success in Europe.. Also the higher
price is due to the high VAT to support the welfare state.

The iMac does not have PCI DUMBASS!!! The current iMac has ATI-Rage 128/
AGP graphics card plus the airport capability..

Get a MacMall catalog or log onto the web sites and see all the USB stuff
for the iMac to end your ignorance..

Actually, the Milan is cheaper than the cheapest P333 PC, on this
side of the Trans-Atlantic Wet Stream, while the iMac costs twice
the price of an overblown PC.

> Looks like the iMac is indeed a success in Europe. The higher
> price is due to the high VAT to support the welfare state.

Even the less-VAT price is twice the 1199 USD list price.

>for the iMac to end your ignorance..

You can use a lot of bulk storage, HID and printer devices
under Linux as well. That still doesn't remove the problem
that any non-standard USB device requires its very own
device driver for any OS you care to use it for.

This includes Win98 vs. WinNT.

>

>
>What are you babbling about? Have you counted whats out there?

That doesn't matter when someone goes to buy a product
and is in a total state of confusion when their !DOS
oriented USB product provide drivers for their platform.

I've actually read the USB spec and I keep up with USB
driver development.

>

>The second largest volume OS. Nice try. Your ignorance is showing..

That must have been why CivCTP was running on Macintoshes
under Linux before it was running under MacOS.

To a market obsessed with what's the biggest cash cow,
second might as well be last.

TIFKAS, you are a childish moron who only gets satisfaction from making light of the choices of others. Are you as small of a person as you appear to be?!?

As far as "misplaced zeal," pretty much ANYONE with any need to "evangelize" a computer platform of ANY kind is silly in my view. It's just a tool.. it's not something important, like a spiritual awakening, a sunset, the birth of a child, creating a work of art, etc.

Your petty, childish, immature "evangelism" cannot make up for what may or may not be missing in your life, so stop trying.. stop using your choice of computer platform as your security blanket and frame of reference.

People see right through your apparent attempt to feel superior by denigrating the choices of others... grow up, buddy. It's time to move on now.

you know, if anyone could do it, it'd be Mario Becroft. Of course, he's
busy right now with the new SCSI/Ethernet adapter for the ASCI port - can
you say cable modem and network for cheap? :) Try that with a same-year
vintage Mac.

BTW, have you seen QwertyX? We had a demo of it at one of the last TAF
meetings, and I'm predicting he's going to have a LOT of success with this
new adaptor. PC keyboard, PC mouse, Atari joystick, remapping of the
keyboard, and all with no hack'n'slash (not that there's anything wrong
with that :)). Ol' TiFKAS must be pucking blood....

Who cares!!! Old Mac users can upgrade to a modern class of Mac models
starting with the new $999 iMac/350 which includes 10/100 base-t, 128 ATI
Rage/AGP with 8 MG Vram, 64 Megs, 6 G, 56k and 14 software titles...Also
can accept the airport card and base. I am sure up north has the fast
selling out new iMac models.. See ehmac.com for the proof.

I have seen many LC users that were rightfully discourage to invest in
upgrades than it was feasible...like a $150 Cd-Rom multimedia kit, extra
memory and new modem that would have added none new capability when you
can goto the open market and purchase a used $400 PM 6500 or used iMac
that can run the latest...The Mac food chain is alive and well..

So? A brand-new Milan is cheaper than a second-hand Falcon,
these days. Same process here. Really nothing to be bragging
about, sinclap. Every platform has its food chain.

It's unfortunate that Apple gouges oversees customers on its hardware. I have an iMac 266 and really enjoy it. It reminds me in many ways of the ST (I used to own a 520ST, a 1040STE, and a Falcon030 back in the day). It's fast, easy-to-set-up, easy-to-use, and reliable. Sure, it tends to crash just as much as my old 1040STE, but I don't mind. ;-)

The iMac isn't w/o fault but it's a damn good, general purpose machine. With a 266Mhz G3 and 160 megs of RAM, I can push plenty of pixels with Photoshop, exchange documents with my office via Micro$oft Word, crank out web pages with BB-Edit, surf the web to my heart's content with Netscape, burn CDRs with Toast, draw sprites with ProMotion 4 under Virtual PC, and even play many classic ST games with NoSTalgia.

The iMac is a decent machine. So was the ST/TT line. I may have converted to a devout form of Macintoshism but I'll always be an Atari fan at heart.

Don't judge the iMac harshly until you use it and don't judge all Mac users by the likes of Sinclair.

Your know, it's pretty sad. I've been reading comp.sys.atart.advocacy since 1993 when I was in college and Sinclair STILL hangs out here!

Doesn't he have anything else to do???

Ari

Source record: 2630

Everyone seems to want to ramble on about Hasbro resurrecting Atari's name for software, all that's going to do is ressurect Atari's past successes like PONG, Centipede and Missile command etc, Now in their day, yes that were great games etc. but even updating them to 32/64/128 or 256 bit standards for graphics/gameplay etc isn't going to help them compete with the like of Tomb raider, Quakes , bango kazooi, Sega rally dreamcast etc. because Atari has only a limited ammount of titles to select from, what going to happen when these dry up, where are the next sales going to come from, perhaps Atari should start selling old ocean or usgold or activision s/w or horror of horrors old CBM64 software from CBM themselves, or colecovision, nes or Sega MD or MS software- do you want this to happen don't you
After all if youv'e followed Atari history in software publishing, you'd know that Atari triedf this type of thing with Atarisoft (converting Atari hits to c64 speecy, amstrad,apple pc etc) and Atari Interactive (converting Atari hits to PS, Saturn and PC) and these futile attempts at getting Atari known as a software developer were only remarkable for their apparent failiures and also because they eventually lead to Atari being bought out or being sold off as a going concern
I accept the fact that Atari failed because of BAD MGMT (Warners & Tramiels resperctively) ABSOLUTELY no consistant and cohesive sales & marketing stragedgy or plans (Tramiels only), or total lack of product knowledge (Warners again) but the 2 main reasons why Atari failed is
A- Atari wasn't prepared to invest in the very technology that it had created, and this was reflected in the fact that heaps of projects were either scraped or put on indefinate hold this is because Atari was ingnorant about the technology it had created, and if one is ingnorant of what one has, then how can you invest in ingnorance (this applies to both the tramiel and Warner managements- And because Atari wasn't prepared to invest in it's own technology, it therefore couldn't advance the developoment of it's own products and therefore it's own technology, which basically turns Atari from a creator and pioneer/inventer in these technologies, into little more then a mass manuf.. of electronic boxes with outdated technology, very much in the same guise of the mentallity of virtually every manuf. of games systems and computer technology.. ie selling masses of plastic boxes with outdated technology, without intending to update or advance the product or in the very least it's technology... Who is conning who, the manufacturers conning the end users, or is it the other way round
After all, it's an established fact that consumers are a fickle bunch, and they no longer have the same loyalty for brands these days as they once did, if that was so then why are Jap co's like sega sony nintendo, dominating an industry, ultimately created by Atari, because- it cant be the technology- because these other manufacturers are essentially

putting Atari technology and design concepts, into theri own plastic electronic boxes, without advancing the development of product or it's technology, and if sega nintendo and sony stay on the same course any longer, they themselves will end up in the same situ. at our beloved atari, ie as a software producer
It's going to need a TRUELY ressurrected Atari (H/W and ALL) to breath some much needed life into a very stale and staid industry, and do something that the Atari of old and also these other so called games h/w manufs. haven't done and never did, and that's simply that Atari has to invest in the technology that it creates and to do that Atari needs to have confidence in the products, and instead of wasting money in ineffective advertising and marketing (which is what all previous Atari managements are guilty of), they should invest that money in advancing this new found technology, into modern standards, or tommorows standards, after all I remember someone telling me that technology designed today, or tommorow only lasts for ONE day
It's just a shame that no-one company has learned from Atari's mistakes and folly, they may think they have but they haven't
After all, you can take a look at any company product or service (doesn't have to be computers or v/g's) and just have a look at how the company views the product or service, after all if you don't have a prod. or svc. you have nothing to sell, nothing to sell= no business, the mistake that companies make these days, is that they've got to modify their sales/marketing, or they've got the snowball the consumer/end user with advertising, or that they've got to change their customer service/customer care program (if they have one) now I admit that these areas of business are very important, but what modern business (Atari included) has overlooked and there fore the most important, is the product or service and USP's/features and benefits are all well and good, but if you are not investing in the future development of your companies product or service, then USPs, features etc are irrelevant and pointless, also why should the consumer buy your products, after all the ultimate investor in any idea, product or service is the person or persons that buy's the idea/prod. or svc, this is called the consumer. and not the company doing the selling.. After all as the consumer is the ultimate investor, surely the consumer has a vested interest in the future development of that product or service, after all the consumer has just invested money in the company, the consumer needs confidence that the company will invest these funds effectively, and looking at it logically, if the company isn't interested in investing in advancing the development of the product or service and in the p/s related technologies, then will the consumer come back tommorow and buy the companies product again, what do you think (after all would you buy the same product using the same technology fromn the same comnpany say in 20 years or in 2 months from now, when you know that their competitors have vastly better products, and they are investing in advancing development of their p/s and related technologies- I DON'T THINK YOU WOULD), by investing in the product and it's technology and development, you are investing in future custom, future custom= more investment in advancing development and technology

in their p/s, only once this is investment framework is
firmly established, then the company then can start investing in
supporting the product, in regards to marketing, advertising, sales,
customer service/care etc, and not the other way arround, which is what
virtually every single company is doing including those outside of the
computing and v'g h/w ind.. After all if companies follow their current
path they will be doing nothing more then making little more then
electronic plastic boxes with outdated technologies, with a very limited
market potential, youv'e all heard of the old saying about flogging dead
horses and ever decreasing circles, think about it each time you go
arround the block, selling the same prod. and each time you do this,
they investment you get (ie people buying the product) isn't being
invested in the godds/services themselves the more times you go arround
the less you sell, you#ll get to the point where your'e not selling, as
you have no product as it's now like flogging dead horses
Tied in with this reason, i refer to a listing that i saw in an American
Business Directory (those Dunn & Bradstreet type jobbies), I remember a
listing for a US company i think it was a small incorporated cloting
company, had a look at it's personnel listing (8 snr vice pres. 5 Exec.
vice pres. 15 vice pres) now your most probably saying, so what, now if
this is for a small cloting co. I'd hate to think of what the numbers
would look like for a larger US multinational- for just one of the US
offices, take a guess 4, 5 or 6 x, or how about 10 or 20 x, and remember
that these people people were hired and put into these positions of
responsibility because they were good at making 'DECISIONS', now think
of this structure, a manager, he has to report to a manager, he then
reports to a manager, who reports to a manager, in another department,
who reports to a manager, her then reports to a manager, who reports to
a manager in another department, and so on and so forth till you get to
the top, and just imagine this same process happening when one
department needs a decision on a new idea in advancing devlopment in
existing product(s) and it's related technology, all it needs is one
manager, be it a VP, SVP or EVP from the same dept, or a related dept or
even a total unrelated dept who have alterior motives to say no, and
that wipes out the entire efforts of one or several entire
divisions/dept... and for what, short term prestige/gains, what about
the long term, what about the continued survival of their product in the
face of competing products (from companies with lesser rigid structures
and also beleive in investing in their p/s future advances and
developement), and not only thant but how will this other company
survive, whats going to happen to the structure of decision making, the
future of their product (so far as advances and deveopments are
concerned), creativity and commitment to the company itself, all that's
going to happen is people will leave, because the company isn't
interested in the product and it's future the people will not have faith
or confidence in the direction the company is taking, it's decision
making process, there will be no creativity and therefore no committment
Essentially the companies structure becomes beaurocratic and therefore
area's like creativity, product advancement and development, decision
making and committment are stifled, to such an extent it drives people

to leave, which is ironic because, wasn't it these very same people that got the company and the product/service to where it is today, and remembering the concept about the consumer being the ultimate investor, if this is so then the penultimate investor is the employees (who have as much vested interest in the future developement and advancement in the companies product/service)and what happens when they leave, everyone moves up one, but the problems stay the say, and because virtually all companies have the same philsophy, are these people who are leaving, going to join their competitors, i don't think so, all that will happen is that they will set up their own company, selling the same prod/serv., wtih the same technology (because they don't yet have the investment to advance the tech.) so straight of the bat they allready in a hole facing an uphill struggle to compete with est'd names, in an ever decreasing market (I was once told that the average market share for any new entrant to any market for the first 5 years is the equivalent to the ammount of brain capacity as used by human beings which is less than 10%, my thought is, is it realy worth it) and because more and more companies are competing for less and less market share (in the same market-ie USA etc) all it will need is a foreign competitor to advance and develope the same product with new technologies, and actually invest in it- and they've virtually got the market sown up, because existing users aren't going to wait while their current suppliers start advancing their product, irrespective and regardless of the quality or their sales/marketing/advertising/customer care/service, because as you remember consumers are very fickle, they want the latest thing, which means they will go with whichever company is prepared to invest in it's own product (thru advances in product/service development and related technologies-thus investing their customer investment wisely/effectively), so therefore theres always going to be a decline in so call brands loyalty- You cannot compute, eat, see or sleep image, or marketing or sales or advertising or customer service/care, these are things that are earnt or created as a resulting of investments made by the consumer, the only way you can create or earn image, marketing, sales ,advertising or customer service/care is by investing in your customers confidence and faith in the future advances and development in the prod./serv., and the only way a self respecting company can invest in this concept, is by doing so.... but no-ones doing so, so ultimately instead of going forward into the '3rd Millenium' we might as well go back to the 1st millenium
Atari failed simply because of what I outlined above, little of no investment in advancing their product and related technologies, little or no creativity, no commitment to atari's concepts, to beaurocratic, you might as well say that virtually every company involved in video games h/w of s/w was born and created on the back of Atari's technology, and unless they change their ways they will suffer the same indignity
Yes, we are still using Atari technology, but it's in someone elses plastic electronic box, sold just like baked beans, jeans, perfume... wheres the sense in that... I though Atari's represented computers and video games h/w with a personality- ie Atari technology in Atari boxes, and not someone elses, BUT with Atari investing in the future advances

and development of their (ATARI'S) product and it's related technologies

The second reason why atari failed is because the American consumer simply gave up on Atari, they didn't like the idea about Atari, an American company dominating an industry that Atari itself had created, so they showed their support to ATARI, by buying sega, nintendo and eventually sony or to put it another way buying, Atari technology in someone elses boxes
interesting when you consider that Sony, Sega & nintendo are JAPANESE companies, and I am constantly told that American's cant stand buying JAP goods (talk about contradiction big time), and according to most european and US computing press and commentary during the tramiel era, it was the European markets (incl.UK) that was keeping Atari going (or at least alive and surviving) whilst you American's were content in buying Sega sony and nintendo, or buying, Atari technology in someone elses boxes

perhaps I am wrong, there again I live in a so called democratic country (England) so i guess with the so called freedom of speach concept (what-freedom of speach- democracy- england, you are joking aren't you) anyway I guess i'm entitled to my opinion, even if others don't neccessarily aggree... But in saying that, as anyone who has an ounce of HUMAN intelligence will know, sooner or latest this internet thing with simply become an unweildy authority with an unweildy institutionalised mentallity

Yours

TORONTO ATARI FEDERATION FLEA MARKET NOVEMBER 17TH!

Yes, folks, it's time once again for users of the classic Atari 8-bit, ST, TT and Falcon computers to come to the annual event where you can divest yourself of what you don't need while at the same time hunt out for what you do! Sell your old stuff, discover a treasure!

Among other things you'll find at this event:

classic systems! Looking for that Falcon? Wished you had an STe and its expanded capabilities? Do you need a 600XL for your collection? There's a good chance you'll find it here!

hard-to-find games, peripherals, literature and applications!

TAF Software Library, carrying hundreds of PD/Shareware games, utilities applications, as well as the TAF Internet discs! Plus we'll be selling 720K floppy disks, stock up! The membership desk will also be up for renewals as well as new members.

the camaraderie of fellow Atari users - swap stories, troubleshoot, ask for advice! Meet some of the faces you've only read online on the Internet!

Ken Macdonald's demonstrations and sales of the various Mario Becroft adaptors for Ataris. Use a PC three-button mouse with the Mouse Adaptor, plug & play, works with Ataris and Amigas! Use a PC keyboard, PC mouse and Atari joystick with the amazing new QwertyX adaptor, no soldering required! Give your ST or STe amazing storage capacity with the Internal IDE Adaptor kit - program storage, add a CD-ROM, use an LS-120 internal drive to replace your disk drive! And, with the VGA Adaptor, use any VGA or SVGA PC monitor with your Atari ST to get a beautiful hi-res display!

All this and MORE!

It's a night of fun and commerce, and it's being brought on by the one, the only, Toronto Atari Federation - bringing you the best in Atari-related computer info and enjoyment since 1984! See you there!

Flea Market details:

Admission and tables for TAF members: Free
Admission for non-members - $2.00 (one thin toonie)
Tables for non-members - $5.00 (admission waived if you purchase a table.

NO STOLEN ITEMS OR PIRATED SOFTWARE ALLOWED! VIOLATORS WILL BE PROSECUTED TO THE FULL EXTENT OF THE LAW.

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Those coming by public transport can take the TTC Yonge Line north to North York Centre Station. $2 for non-members. Dues are $25 per year, and includes a subscription to the newsletter PHOENIX. Membership in TAF IS Atari support!

no, but I think that they would be afraid of the RCMP. And the Toronto City Police. And the Ontario Provincial Police. All of whom have the best interests of the public in mind to any cretins who think they can fence stolen or pirated property at our events. And the fact that they could go to jail for a very very long time and face stiff fines (software piracy IS a federal offence here, punishable by a ten year jail sentence and fines of up to $1M)

And besides, I don't threaten. I warn. And I make promises that I keep .:)

and look who's calling me "spineless" - the little jellyfish who has no backbone or fortitude to back up his boastings with fact.

seeing as this is coming from the unbelievable, lying-sack-of-rat hair
known as TiFKAS, we really can't believe you.

And once again basing insults on appearance of people you haven't met
face-to-face? My my, TiFKAS, what a bitter petty person you are - did you
also beat up on crippled kids when you were little?

BTW, it's spelled "acne" and "re-engineered". Proof positive that no
one would ever hire such an utter idiot as you at Apple other than as a
janitor...

once again, your utter hatred of feminists is coming to the fore,
TiFKAS. Did a feminist bitch-slap you when you said something amazingly
sexist?

You were warned TWICE not to send me e-mail, pinhead. And I know you've
taken part in this behaviour of intimidation several times with those you
disagreed with, to the point that you were kicked off Hotmail in one
incident.

Like I said, I don't threaten - I make promises which I intend to keep.
>

That's about $500 worth of PC, mebbe less. It really doesn't
do your position any good to brag about how overpriced a
Mac with skanky PC hardware is.

[deletia]

You can't demonstrate what this years version of msoffice
can do over last years version of clarisworks & the mac is
a second class 'entertainment' software platform.

Better advice would be for him to pick up a $200 dreamcast
and mebbe a copy of SoulCaliber... '-ppp

You do know that you can get both of those kinds of adaptors
for USB? Although, you still have to cover the device driver.
Then again, Linux or FreeBSD source could be useful in such
an endeavor.

Nah, I'm a Linux user. I might eventually get around to buying
a PPC system capable of running MacOS instead of running Linux
on my Kludge Klone, however I am still technically a 'PC user'.

The biggest dissuasion there (me buying a Mac) is the lack of
suitably optimized compilers and the crap vidcards Apple insists
on shipping with it's machines (ATI).

[deletia]

The effective Apple argument has always been convenience
and performance. Price has never been an Apple strong point.
Price is an issue best AVOIDED by a MacVocate.

Its quite easy to press charges against pirates. You just tell the software distributors who and what is the problem, and in no time they'll have police knocking on the door of the perpetrator asking to see their receipt of purchase or licence. At least thats how it works here...

It is you who are spineless sinclap. It is also evident that your general knowledge is sadly lacking. If, for example, I knew you to be using pirated software, I could call the distributors of the software and dob you in with relative ease. They would have no problem in tracking you down and investigate you for illegal software use...and I could do that even from here in New Zealand!

Get a reality check pal...

Until relatively recently non-commercial software piracy
wasn't even a criminal offense in the US. Now it's still
only a criminal offense if the 'total theft' is $1000 or
more.

Unless he was distributing, the SPA (the people who you would
want to snitch to) would really not be interested. Depending
on the platform they might not even care.

There was a Atari snitch that experienced indifference from the
SPA at some point before Atari finally went under. Apparently
they didn't care since the offense wasn't being perpetrated
against a member company.

a good reality check would probably be for ol' TiFKAS, seeing as he thinks he so smart, to try to sell some pirated software or stolen property at the TAF Flea Market - a police choke hold, a night in the Don Jail, and a deportation hearing may be just enough for him to get the slightest nugget of a clue in that thick head of his :)

Thnaks for the support guys..

and, TiFKAS - heard about the Daily Tubby? Seems the good news is that they've achieved fairly good readership. The BAD news is that they've lost $37M and they're still bleeding red ink, and there's some scepticism about those numbers - know that the Tubby has one of the highest remaindered amounts at newstands in Toronto?

"But what are the upper crust? Just a bunch of crumbs being held together by dough!"

A minor correction, the old iMacs ran on a PCI bus, they just didn't have a PCI slot...for the most part. Apple DID include a "mezzanine" connector on the bottom of the "Bondi Blue" iMacs. I have a Voodoo2 card in mine right now.

Bitch to get to though.

The new iMacs run on a Firewire bus under UMA I believe.

I agree on the videocard issue, my iMac now has a 3Dfx chipset in it,
(see previous post). The ATI is really pathetic.

When it comes to compilers, I was under the impression Codewarrior was
good. However, they have been bought out by Motorola, so things should
improve further.

A Metrowerks compiler for Linux does not yet exist.
What Metrowerks is shipping is just the IDE with
gcc underneath.

I guess I'm refering to commercial software. 'Owning' even a small
pirated program worth say US$100 is considered an investigable crime
if the distributor/author wish to pursue it here. A few illegal ops
have been uncovered here based on following an individual user back
down the chain...

> Unless he was distributing, the SPA (the people who you would
> want to snitch to) would really not be interested. Depending

Even if he wasn't distributing, the author would have their best interests
at heart to see where he got his copy from...

> >you for illegal software use...and I could do that even from here in New
> >Zealand!
>
> Don't assume that copyright law is Universal.

Copyright law isn't universal as you correctly point out, but the telephone
system is! A phone call to a lawful distributor/author is all it has taken
in a few cases here to get the ball rolling, and eventually bring down a
pirated software ring...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

No it isn't. The USC section on what constitutes
criminal piracy clearly states that the total
offense must be $1000 or more or that the software
is being rented or resold.

The $1000 non-commercial piracy bit only was added within
the last 18 months.

Previously, no piracy not for commerical gain was a
criminal offense in the US.

The most an author could get out of such a cause of action
is spite litigation and even a judgement in that instance
would be dischargable.

Sounds like the prisoners dilemma in action, with a little fraud thrown in.

Not in the US.

Until fairly recently, ALL non-commercial piracy
of any kind was a purely civil matter.

[deletia]

The current 'criminality threshold' in the US is $1000.

Amiga has been "making a comeback" for the last 10 years, to the point that User Friendly comics had something on the topic.

Anyhow, most users are now running Linux on their Amiga so, what remains of the Amiga fame, other than the hardware?

I was initially amused when I heard the "big news" from Gateway, but seeing as they are looking at the same lame Intel crap other meatball PCs out there use (so what if it runs Linux on it?), no one could ever consider call that an Amiga so, what's the point?

The Amiga was interesting primarily because of what
was outside of the CPU. One could still make an
Amiga-esque intel box. Hell, the Amiga's themselves
had ISA slots.

Admittedly, such a venture would be too much work for
any 'cheap over everything' PC vendor to undertake.

Won't happen, at least not from AInc.

Anyhow, most users are now running Linux on their Amiga so, what
remains of the Amiga fame, other than the hardware?

Really?. Most?. Did you just make that up ot was it a guess?. Most Amiga
owners still run AmigaOS in reality. OS3.5 has just been released don't you
know...

I agree but...

What is your problem with Intel CPU's exactly?. Isn't it somewhat ironic
that you consider 500Mhz plus Intel CPU's as lame crap when you are probably
still using an old, outdated and performance handicapped 680x0 on an Atari
?.

Let's put things in perspective here.

Regards,

Clockmeister.

Actually, around here, the Amiga and Atari scenes are not as
compartimented as elsewhere and everyone I know uses Linux 68k.

> Most Amiga owners still run AmigaOS in reality. OS3.5 has

Indeed, let's do that:

I am presently answering this mail using Pine on MiNT. The binary
size is just below 2MB and memory consumption too. On Linux PC,
make that 5 MB and 8 MB, respectively, for the same Pine version.

Basicaly, Intel technology is so bloated that a port of the same
package requires 3 to 4 times the amount of system resources and
a CPU a 100 times faster, to become usable.

So, is Motorola 680x0 technology really so outdated?
The numbers spoke; I rest my case.

Actually, around here, the Amiga and Atari scenes are not as
compartimented as elsewhere and everyone I know uses Linux 68k.

Around here, and judging by the newsgroups and the ever increasing amount of
software (on Aminet) for AmigaOS, the rest of the world still uses AmigaOS
primarily.

> Most Amiga owners still run AmigaOS in reality. OS3.5 has
> just been released don't you know...

So I heard, but nobody is using that anymore. See above.

Nobody where you live maybe... see my point above.

Yeah, right.

So, is Motorola 680x0 technology really so outdated?
The numbers spoke; I rest my case.

Based on Pine?. Some people place somewhat higher demands on their systems... try rendering something, or some multimedia applications. 68k don't cut it anymore.

I rest my case.

Yes, but the ISA slots where completely isolated from the Amiga and could only be accessed via a bridgeboard (PC card) and then only by the PC card itself.
A Goldengate card can access and utilize the ISA slots in a bigbox Amiga, but these weren't available until much later.

By reading the findingg of fact, I just realized that if it weren't for Netscape not taking MS's offer to split the browser market back in 1995, Mac users will not have been able to surf the net today! We owe a lot to Netscape. They died like men.

"Also extremely damaging to Microsoft, the judge sided with then Netscape CEO James Barksdale version of a meeting between Netscape and Microsoft executives in June of 1995. In that meeting Barksdale alleged that Microsoft offered to divide the browser market with Netscape in a way that Microsoft would provide its Internet Explorer Web browser for Windows PCs, relegating Netscape to the tiny market place of other computers like the Macintosh and Unix servers. •Had it convinced Netscape to accept its offer of a •special relationship,• Microsoft quickly would have gained such control over the extensions and standards that network-centric applications (including Web sites) employ, as to make it all but impossible for any future browser rival to lure appreciable developer interest away from Microsoft•s platform,• the judge stated."

4455. M$ Judge Declares Macintosh "Harmless"

Date: 1999-11-06 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <dreibel-0611990903210001@ts7-52t-9.idirect.com>
Source record: 2669

"The judge said that operating systems on other systems, like the Macintosh, hand-held devices like the Palm Pilot and network computers do not compete with Microsoft Windows, and are therefore not a threat to Microsoft's lock over the PC operating system."

4456. Fun references to Apple in the Findings of Fact

Newsgroup: comp.sys.atari.advocacy
Date: 1999-11-06 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <dreibel-0611990917120001@ts7-52t-9.idirect.com>
Source record: 2670

another message from Znu on the findings in fact on M$ - and about Apple.

Znu presents all the good and bad regarding Apple in the judge's ruling, unlike a certain clueless troll who, when not hallucinating about his imaginary friend "Chunks", pretends to be an "Apple Power Rep"...

In case you missed it, see http://usvms.gpo.gov/findfact.html and http://www.msnbc.com/news/329416.asp

In the interest of fairness, I'm going to present just about all the Apple references in the 207 page document, not just the ones that back up the Mac advocate view.

"In 1995, Microsoft introduced a software package called Windows 95, which announced itself as the first operating system for Intel-compatible PCs that exhibited the same sort of integrated features as the Mac OS running PCs manufactured by Apple Computer, Inc. ("Apple"). Windows 95 enjoyed unprecedented popularity with consumers, and in June 1998, Microsoft released its successor, Windows 98."

MS is copying Apple.

"The response to a price increase would be somewhat greater among consumers buying their first PC system, because they would not have already invested time and money in an Intel-compatible PC system and a set of compatible applications. Apple does not license the Mac OS separately from its PC hardware, however, and the package of hardware and software comprising an Apple PC system is priced substantially higher than the average price of an Intel-compatible PC system. Furthermore, consumer demand for Apple PC systems suffers on account of the relative dearth of applications written to run on the Mac OS. It is unlikely, then, that a firm controlling the licensing of all Intel-compatible PC operating systems would lose so many new PC users to Apple as the result of a substantial, enduring price increase as to make the action unprofitable. It is therefore proper to define a relevant market that excludes the Mac OS. In any event, as Section III of these findings demonstrates, including the Mac OS in the relevant market would not alter the Court's conclusion as to the level of Microsoft's market power."

The Mac doesn't compete with Windows.

"The inability of Apple to compete effectively with Windows provides another example of the applications barrier to entry in operation. Although Apple's Mac OS supports more than 12,000 applications, even an inventory of that magnitude is not sufficient to enable Apple to present a significant percentage of users with a viable substitute for Windows. The absence of a large installed base, in turn, reinforces the disparity

between the applications made available for the Mac OS and those made available for Windows, further inhibiting Apple's sales. The applications barrier thus prevents the Mac OS from hindering Microsoft's ability to control price, regardless of whether the Mac OS is regarded as being in the relevant market or not."

The applications barrier to entry is nearly impossible to overcome.

"In their discussions with Apple, Microsoft's representatives made it clear that, if Apple continued to market multimedia playback software for Windows 95 that presented a platform for content development, then Microsoft would enter the authoring business to ensure that those writing multimedia content for Windows 95 concentrated on Microsoft's APIs instead of Apple's. The Microsoft representatives further stated that, if Microsoft was compelled to develop and market authoring tools in competition with Apple, the technologies provided in those tools might very well be inconsistent with those provided by Apple's tools. Finally, the Microsoft executives warned, Microsoft would invest whatever resources were necessary to ensure that developers used its tools; its investment would not be constrained by the fact that authoring software generated only modest revenue.

....

Jobs reserved comment during the meeting with the Microsoft representatives, but he explicitly rejected Microsoft's proposal a few weeks later. Had Apple accepted Microsoft's proposal, Microsoft would have succeeded in limiting substantially the cross-platform development of multimedia content. In addition, Apple's future success in marketing authoring tools for Windows 95 would have become dependent on Microsoft's ongoing cooperation, for those tools would have relied on the DirectX technologies under Microsoft's control."

Here we see MS trying to kill QuickTime for Windows.

"Finally, it is significant that, while all vendors of PC operating systems undoubtedly share Microsoft's stated interest in maximizing consumer satisfaction, the prohibitions that Microsoft imposes on OEMs are considerably more restrictive than those imposed by other operating system vendors. For example, Apple allows its retailers to remove applications that Apple has pre-installed and to reconfigure the Mac OS desktop. For its part, IBM allows its OEM licensees to override the entire OS/2 desktop in favor of a customized shell or to set an application to start automatically the first time the PC is turned on. The reason is that these firms do not share Microsoft's interest in protecting the applications barrier to entry."

Wasn't there a question about whether Apple allowed this?

"Recognizing the importance of Mac Office to Apple's survival, Microsoft threatened to cancel the product unless Apple compromised on a number of outstanding issues between the companies. One of these issues was the extent to which Apple distributed and promoted Internet Explorer, as

opposed to Navigator, with the Mac OS."

MS essentially forced IE on Apple

Well, there are some rather interesting comments on Apple in this. Most notably, he judge seems to have divided that from MS's point of view, Apple is not a competitor.

I'd like to point out before some PC users cease on this to try to prove Apple is a monopoly that just because Apple isn't a competitor to MS does NOT mean that MS isn't a competitor to Apple. IOW, MS can double prices without worrying about many people a Mac, Apple can't double prices without worrying about many people getting a PC.

--

4457. Apple pressured over Netscape - excerpt from fact finding

Newsgroup: comp.sys.atari.advocacy
Date: 1999-11-06 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <dreibel-0611990932580001@ts7-52t-9.idirect.com>
Source record: 2671

well well well, the truth will out - and the Reality-Distortion Field
is crumbling....

seems that ol' Bill Gates WAS ready to crush Apple like a bug if Steve
Jobs didn't capitulate on IE4 on the Mac! Just like he did with John
Sculley when Apple dared to try to market their own version of BASIC that
directly competed with M$. And Jobs thinks Sculley was a feeble-brained
wimp?

How does it feel, TiFKAS, now that it has been proven that Jobs didn't
have the cojones to immediately report Gates to the proper law
authorities, but instead immediately sold out Apple to Microsoft?

Excerpt from findings of fact regarding Microsoft's threats to cancel
Office in an attempt to get Apple to deemphasize Navigator. If you think
this is too long to read it all, just be sure you read the last paragraph.

6. Foreclosing Apple as a Distribution Channel for Navigator

341. In the summer of 1995, Microsoft had been willing to cede to
Netscape the development of browsing software for the Mac OS, provided
that Netscape would stop competing with the platform-level browsing
technologies that Microsoft was developing for its 32-bit Windows
products. The genesis of this offer had been Microsoft's belief that
Netscape could never become the leading platform for network-centric
software development if it did not distribute a middleware layer for the
soon-to-be dominant 32-bit Windows platform. But once Netscape confirmed
its determination to offer a middleware layer that would expose the same
set of APIs on Windows, the Mac OS, and other platforms, Microsoft
recognized that it needed to stifle the attention that developers would
be inclined to devote to those APIs, even when the they rested on top of
a non-Windows platform like the Mac OS. After all, if Navigator became
so popular on the Mac OS that developers made extensive use of the APIs
exposed by that version of Navigator, those developers would be disposed
to take advantage of identical APIs exposed by the version of Navigator
written for the dominant platform, Windows. Microsoft therefore set out
to convince developers that applications relying on APIs exposed by
Navigator would not reach as many Mac OS users as applications that
invoked platform technologies found exclusively in Windows. Therefore,
Microsoft set out to recruit Mac OS users to Internet Explorer, and to
minimize Navigator's usage share among Mac OS users.

342. Just as pre-installation and promotion by OEMs is one of the most
effective means of raising the usage share of browsing software among
users of Intel-compatible PC systems, pre-installation and promotion by
Apple is one of the most effective means of raising the usage share of

browsing software among the users of Apple PC systems. Recognizing this, Bill Gates consistently urged Microsoft executives to persuade Apple to pre-install the Mac OS version of Internet Explorer on its PC systems and to feature it more prominently than the Mac OS version of Navigator.

343. By the summer of 1996, Apple was already shipping Internet Explorer with the Mac OS, but it was pre-installing Navigator as the default browsing software. After a meeting with Apple in June 1996, Gates wrote to some of his top executives: "I have 2 key goals in investing in the Apple relationship - 1) Maintain our applications share on the platform and 2) See if we can get them to embrace Internet Explorer in some way." Later in the same message, Gates expressed his desire that Apple "agree to immediately ship IE on all their systems as the standard browser."

344. One point of leverage that Microsoft held over Apple was the fact that ninety percent of Mac OS users running a suite of office productivity applications had adopted Microsoft's Mac Office. In 1997, Apple's business was in steep decline, and many doubted that the company would survive much longer. Observing Apple's poor performance in the marketplace and its dismal prospects for the future, many ISVs questioned the wisdom of continuing to spend time and money developing applications for the Mac OS. Had Microsoft announced in the midst of this atmosphere that it was ceasing to develop new versions of Mac Office, a great number of ISVs, customers, developers, and investors would have interpreted the announcement as Apple's death notice.

345. Recognizing the importance of Mac Office to Apple's survival, Microsoft threatened to cancel the product unless Apple compromised on a number of outstanding issues between the companies. One of these issues was the extent to which Apple distributed and promoted Internet Explorer, as opposed to Navigator, with the Mac OS.

346. At the end of June 1997, the Microsoft executive in charge of Mac Office, Ben Waldman, sent a message to Gates and Microsoft's Chief Financial Officer, Greg Maffei. The message reflected Waldman's understanding that Microsoft was threatening to cancel Mac Office:

The pace of our discussions with Apple as well as their recent unsatisfactory response have certainly frustrated a lot of people at Microsoft. The threat to cancel Mac Office 97 is certainly the strongest bargaining point we have, as doing so will do a great deal of harm to Apple immediately. I also believe that Apple is taking this threat pretty seriously . . . . 347. Waldman was actually an advocate for releasing Mac Office 97 promptly, and he pressed for that outcome in his message to Gates and Maffei. Although they applauded Waldman's devotion to the product, Gates and Maffei made clear that the threat of canceling Mac Office was too valuable a source of leverage to give up before Microsoft had extracted acceptable concessions from Apple. Maffei wrote Waldman, "Ben - great mail, but [we] need a way to push these guys and this is the only one that seems to make them move." In his response to Waldman, Gates asked whether Microsoft could conceal from Apple in the coming month the fact that Microsoft was almost finished developing of

Mac Office 97.

348. In order to assure his superiors that he was pursuing corporate policy despite his personal convictions, Waldman reported to Maffei in his June 1997 message that he had recently told his counterpart at Apple that Maffei "would be recommending to Bill [Gates] that we cancel Mac Office 97." Waldman believed that his counterpart "got the message that we would, in fact, cancel." Waldman went on to write that when his counterpart had asked what specific problems Microsoft had with Apple's recent response to Microsoft's proposals, Waldman had replied by mentioning four issues, including "IE equal access." By that, Waldman meant Microsoft's demand that the Mac OS make Internet Explorer just as available to its users as it made Navigator. According to Waldman, the Apple employee had responded that Apple would not be able to change the Mac OS's default browser from Navigator until it released the next version of the operating system product in the summer of 1998.

349. A few days after the exchange with Waldman, Gates informed those Microsoft executives most closely involved in the negotiations with Apple that the discussions "have not been going well at all." One of the several reasons for this, Gates wrote, was that "Apple let us down on the browser by making Netscape the standard install." Gates then reported that he had already called Apple's CEO (who at the time was Gil Amelio) to ask "how we should announce the cancellation of Mac Office . . . ."

350. Within a month of Gates' call to Amelio, Steve Jobs was once again Apple's CEO, and the two companies had settled all outstanding issues between them in three agreements, all of which were signed on August 7, 1997. Under the agreement titled "Technology Agreement," which remains in force today, Microsoft's primary obligation is to continue releasing up-to-date versions of Mac Office for at least five years. Among the obligations that the Technology Agreement places on Apple are several relating to browsing software.

351. First, Apple has agreed, for as long as Microsoft remains in compliance with its obligation to support Mac Office, to "bundle the most current version of Microsoft's Internet Explorer for Macintosh . . . with all system software releases for Macintosh Computers (`MacOS') sold by Apple." The Technology Agreement also provides: "While Apple may bundle browsers other than Internet Explorer with such Mac OS system software releases, Apple will make Internet Explorer for Macintosh the default selection in the choice of all included internet browsers (i.e., when the user invokes the "Browse the Internet" or equivalent icon, the Mac OS will launch Internet Explorer for Macintosh)." In fulfillment of this requirement, Apple did not include Navigator in the default installation of the Mac OS 8.5 upgrade product. In other words, Navigator is not installed on the computer hard drive during the default installation, which is the type of installation most users elect to employ. Therefore, most users who upgraded their Macintosh systems to Mac OS 8.5 were unable to access Navigator without doing a customized

installation. Having already installed an altogether adequate browser (Internet Explorer) when the Mac OS 8.5 upgrade completed its default installation process, however, most users are unlikely to trouble to install Navigator as well.

352. The Technology Agreement further provides that "[a]ny other internet browsers bundled in the Mac OS system software sold by Apple shall be placed in folders in the software as released." In other words, Apple may not position icons for non-Microsoft browsing software on the desktop of new Macintosh PC systems or Mac OS upgrades. Moreover, the agreement states that "Apple will not be proactive or initiate actions to encourage users to swap out Internet Explorer for Macintosh." Both Apple and Microsoft read this term to prohibit Apple from promoting non-Microsoft browsing software. The agreement even states that Apple will "encourage its employees to use Microsoft Internet Explorer for Macintosh for all Apple-sponsored events and will not promote another browser to its employees." Pursuant to this provision, Apple's management has instructed the firm's employees to not use Navigator in demonstrations at trade shows and other public events. Also with regard to the promotion of browser technology, the agreement requires Apple to display the Internet Explorer logo on "all Apple-controlled web pages where any browser logo is displayed." Finally, the agreement grants Microsoft the right of first refusal to supply the default browsing software for any new operating system product that Apple develops during the term of the agreement.

353. At the same time that it entered the Technology Agreement, Microsoft concluded a "Preferred Stock Purchase Agreement" and a "Patent Cross License Agreement" with Apple. These latter two agreements place obligations on Microsoft that are unrelated to Mac Office, and they bind Apple in areas other than browsing software. The fact that Microsoft and Apple entered two other agreements at the same time that they entered the Technology Agreement does not change the fact that Microsoft's commitment to continue developing Mac Office was at least partial consideration for Apple's commitment to distribute and promote Internet Explorer more favorably than Navigator. Indeed, the language of the agreements themselves demonstrates that Microsoft and Apple saw the Mac Office and Internet Explorer obligations as more closely linked to each other than to any other obligations the parties simultaneously undertook: Whereas the provision in the Technology Agreement setting forth Apple's obligations relating to browsing software explicitly states that those obligations will last as long as Microsoft complies with its obligation to continue supporting Mac Office, the provisions in the other two agreements describing the patent cross-license and Microsoft's purchase of Apple stock mention neither browsing software nor Mac Office.

354. That the Mac Office and browsing software obligations are tied to each other is highlighted by the fact that the Microsoft executives who negotiated the agreement believe that Microsoft's remedy, were Apple to fail to meet its obligations with respect to browsing software, would be

to discontinue Mac Office. When, in February 1998, a Microsoft employee proposed giving Apple an HTML control in exchange for Apple's agreement to use Internet Explorer as its standard browser internally, Waldman informed the employee that Apple was already obligated to use Internet Explorer as its standard browser internally and that Microsoft would revive the threat to discontinue Mac Office if Apple failed to comply with its obligation. In Waldman's words:

Sounds like we give them the HTML control for nothing except making IE the "standard browser for Apple?" I think they should be doing this anyway. Though the language of the agreement uses the word "encourage," I think that the spirit is that Apple should be using it everywhere and if they don't do it, then we can use Office as a club.

For at least a year after the Technology Agreement went into effect, Waldman and other Microsoft employees continued to use the threat of reduced commitment to Mac Office in holding Apple to its commitments to support Internet Explorer.

355. Apple increased its distribution and promotion of Internet Explorer not because of a conviction that the quality of Microsoft's product was superior to Navigator's, or that consumer demand for it was greater, but rather because of the in terrorem effect of the prospect of the loss of Mac Office. To be blunt, Microsoft threatened to refuse to sell a profitable product to Apple, a product in whose development Microsoft had invested substantial resources, and which was virtually ready for shipment. Not only would this ploy have wasted sunk costs and sacrificed substantial profit, it also would have damaged Microsoft's goodwill among Apple's customers, whom Microsoft had led to expect a new version of Mac Office. The predominant reason Microsoft was prepared to make this sacrifice, and the sole reason that it required Apple to make Internet Explorer its default browser and restricted Apple's freedom to feature and promote non-Microsoft browsing software, was to protect the applications barrier to entry. More specifically, the requirements and restrictions relating to browsing software were intended to raise Internet Explorer's usage share, to lower Navigator's share, and more broadly to demonstrate to important observers (including consumer, developers, industry participants, and investors) that Navigator's success had crested. Had Microsoft's only interest in developing the Mac OS version of Internet Explorer been to enable organizational customers using multiple PC operating-system products to standardize on one user interface for Web browsing, Microsoft would not have extracted from Apple the commitment to make Internet Explorer the default browser or imposed restrictions on its use and promotion of Navigator.

356. Microsoft understands that PC users tend to use the browsing software that comes pre-installed on their machines, particularly when conspicuous means of easy access appear on the PC desktop. By guaranteeing that Internet Explorer is the default browsing software on the Mac OS, by relegating Navigator to less favorable placement, by requiring Navigator's exclusion from the default installation for the

Mac OS 8.5 upgrade, and by otherwise limiting Apple's promotion of Navigator, Microsoft has ensured that most users of the Mac OS will use Internet Explorer and not Navigator. Although the number of Mac OS users is very small compared to the Windows installed base, the Mac OS is nevertheless the most important consumer-oriented operating system product next to Windows. Navigator needed high usage share among Mac OS users if it was ever to enable the development of a substantial body of cross-platform software not dependent on Windows. By extracting from Apple terms that significantly diminished the usage of Navigator on the Mac OS, Microsoft severely sabotaged Navigator's potential to weaken the applications barrier to entry.

>The numbers spoke; I rest my case.

These discussion of bloated software vs technology isn't so clear cut. I think you have rested your case to soon, and therefore shall not be allowed a rebuttle:-).

My ST let alone my TT and Falcon can outperform a PC in certain respects. The argument would be similar to yours. An Amiga could make a similar Claim.

But this has little to do with current technology. Object rendering is something that requires horsepower, and you can never have to much.

While I haven't seen it myself, apparently the speed of Atari software on PC emulators and on Magic Mac is Very Fast.

The ST and Falcons are like sportscars to me. Great handling poor horsepower. And in a race handling is always superior to horsepower. But one always respects power.

I would love to have a 500mhz ST:-). But I am very comfortable with my ST or my falcon for internet activity and when using NEWsie there is little difference. Probably would be similar if I were using Pine.

The 68000 Technology is not necessarily outdated as it performs adequately. But that doesn't mean that if more power were offered, Atari Users wouldn't grasp at the opportunity.

As for me a Graphic Card and Ethernet adapter for my TT would suffice:-).

Yes this is an Atari newsgroup, but you will see a LOT of drivel
about Micro$loth and Apple. Usually this is because few people
have enough 'dirt' to really get stuck into the Atari platform.

It is after all an advocacy newsgroup, which apparently gives PC
and Mac users free reign to try and stick it Atari issues. It also
gives Atari users free reign to forward rebuttal on said issues, and
give a bit in return over Mac/PC issues... ;^)

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

seeing as I know many Atarians making good use of their STs day-to-day, and having witnessed how Amigans are just as productive, you are correct in that accessment.

I can vouch for it - I went to Joe Connor's house on one of my UK visits and he showed me his Powerbook/Duo Dock setup running under MagiCMac - really stable and quite fast (he was using it to produce Atari Computing literally in-house at that point). DA's Layout and Papyrus literally screamed.

that's the thing regarding the ST - many people said that STs were too old, slow and archaic to properly access the Internet. And then Alexander Clauss, Dan Ackerman and the other guy went and came up with STiK, CAB and the CAB.OVL.

That's the great thing about Atari, be told that Atarians can't do it, and then do it and ask them if they want their crow boiled or fried :)

>
> The 68000 Technology is not necessarily outdated as it performs adequately.

I thought it was interesting to find out that the Palm Pilot actually
uses a 68000 processor at its core - amazing what "yester-decade
technology" can still do...

> But that doesn't mean that if more power were offered, Atari Users wouldn't

you'd bet I would! :)
>
> As for me a Graphic Card and Ethernet adapter for my TT would suffice:-).

I'm currently looking at possibly going for a used PowerComputing
machine as my main computer, that and MagiCMac look out! But I'm still
keeping the Falcon for MIDI and as a backup for my Internet use should the
Mac go down.

Of course, things could change - if I go on another UK trip next year,
I'll check into System Solutions and get me one of those new Milans in kit
form if I'm sufficiently impressed :)

TIFKAS, are you are a childish moron who only gets satisfaction from making light of the choices of others? Are you as small of a person as you appear to be?!?

Pretty much ANYONE with any need to "evangelize" a computer platform of ANY kind is silly in my view. It's just a tool.. it's not something important, like a spiritual awakening, a sunset, the birth of a child, creating a work of art, etc.

Your petty, childish, immature "evangelism" cannot make up for what may or may not be missing in your life, so stop trying.. stop using your choice of computer platform as your security blanket and frame of reference.

People see right through your apparent attempt to feel superior by denigrating the choices of others... grow up, buddy. It's time to move on

now.

-Mark

OK, the basic web pages are now up, only two pages but it will be growing v.soon and hopefully v.fast.

The link is http://www.1632systems.co.uk from here you can link to Sales catalogue which should now be functional if a little sparse (graphically wise)

My thanks to those of you who have commented on catalogue and taking comments on board.
1) Hopefully postal rates are now sorted..
2) more graphics will be added with longer description, this will be over next two weeks.
3) On the web site, we will be archiving help files (cheats) for Falcon , Lynx and Atari games. These files will be available for download.

We do have other projects in mind so please let me know what you want to see.

Nick Harlow
16/32 Systems

Knock knock who's there? Were did I state that the person in question is
a murderous Atari cretin? Such wild imagination. If I had the
Transputer, would be on the block at ebay. Would use the proceeds to buy
more AOL stock..

The Palm OS has 80% marketshare in the handheld market. Even some of the WinCE makers are giving up.

Lets see...APPL stock is at $88 from Friday's session with a $4 gain. Plus AAPL $12 million investment that translates into a 5% holding in Akamai is worth $600 million! Andrew Neff has upgraded AAPL stock target price for the umteenth time this year...

I feel for that women wo was on the cover on Money magazine some months ago for being conned by her (ex?)boyfriend for blowing 30 grand into Atari and cashing out at below $1000. Only a Jim Jones Jihad could of done that..

It's a shame this stuff is going to waste. I just don't use it anymore.

SEAGATE ST-157N (45 Meg) SCSI HD $10
MAXTOR XT-8380S (380 MB) SCSI HD $50
SC-1224 Color Monitor (Minus Vid. cable) $60
Golden Image Hand Scanner (4", mono) with Scanning tray $60

I'm in Florida in the USA, and buyer must pay shipping. If interested in
any item, let me know where you are and I'll check into the mailing
cost.

HELLLLLLLOOOOOO SILLCLAP?! NOBODY HOME?

How many times do I have to say it?

average PC 3000 FIM
Milan 4500 FIM
iMac 350 8000 FIM

Sorry, I don't call that a "cheap" iMac.

Until Jobs does what his ancestral pantronym tells him to and
price it right, iMac it will not be, for me.

I bet 'Chunks' will begin making calls to dispute this..

Mac Shortages Widespread Globally

Friday, November 5, 1999

By Applelinks Contributing Editor Charles W.
Moore

I received a note yesterday from fellow Nova Scotian reader Waye
Mason, who asked:

"Have you noticed that Innovative Systems and Atlantis Kobetek
[the latter are
both prominant N.S. Apple authorized resellers] AND
MacWarehouse [currently
the sole national mail order Mac reseller] have no Macs to
sell in Canada? This
concerns me deeply. Atlantis and Innovative have NO computers
of ANY KIND to
sell, and have not for 2 weeks! With your network, do you know
if this is the case
in the US, overseas, in the rest of Canada?"

Well, last week it was reported that the reseller channels are empty
in Sweden and the U.K. too,
except for some high-end PowerBooks. However, this is a moving
target. There are reports from
dealers across Canada that a few new iMac DVs have been trickling in.

I contacted Peter Gnemmi, the president of one of the Nova Scotia
resellers Waye Mason
mentioned -- Atlantis Kobetek Inc. -- to get his perspective on this
issue. Peter told me that Atlantis
has had recent delivery of a couple of iMac DVs and a couple of
PowerBooks. He says that G4s are
pretty easy to get, that 350 Mhz iMacs are currently impossible to
find even in the US., but that he is
getting getting a "whole pile" of iMac DVs in next week.

Update: One of the Mac Websites yesterday reported that the $999
entry-level 350 MHz iMacs are
just now beginning to enter the US distribution channels.

It seems that product shortages are beleaguering Apple resellers all
over. Yesterday, AisaBizTech

reported that Apple Japan is also being plagued by product deliver delays.

While Apple Japan had expected to announce three new iMac models on Oct. 16, the release had to
be delayed due to lack of product availability, and iBook supplies are thin on the ground as well.

"We have already received orders for about 450 [iBook] units, but only 45 units have been
shipped," a spokesman of reseller Joshin Denki Co., Ltd. told AsiaBizTech.

This constipation in the channels plus the fact that Apple Japan has reportedly squeezed retailers'
margins on systems from 10 percent or more down to just 6 percent to 7 percent, is not a formula
for happy campers in the retail community, although AsiaBizTech reports that "Retailers generally
support [Apple's] distribution and sales system."

Back in Canada, a member of the Mac-Can email list who works for iPoint Computing, an Apple
reseller in Montreal, notes that his firm received 4 new iMacs so far on Monday.

However, when I called MacWarehouse Canada a few minutes before this article was posted, I was
told that there are no iBooks and no iMacs (either second generation units or leftover Revision Ds)
in stock. When would they be available? "Likely in a couple of weeks." Did MacWarehouse
Canada have any computers at all for sale? "A few 350 MHz G4s." I was told. I imagine that
MacWarehouse is just as steamed about this as are Canadian Mac consumers.

VERY MUCH SO.

Especially on machines as overpriced as
Apple's have always tended to be. ATI
survives much like Microsoft because it
shoves crap down people's throats through
the OEM channels. In any vidcard generation,
it's always at the trailing edge of the pack.

>in price....You should be worrying about the Milan price..

Cheap is always relative. As always, for any given level
of functionality the Apple's are more expensive. Without
SCSI to change the balance of things, this is really quite
pathetic.

These days, the Apple's are little more than PC Kludge Klones
with PPC cpu's on the mainboard rather than fast 386's.

Let me see...

"Jihad" seem to be the key operative word here...by definition a "Jihad"
is someone who is fanatical and an extremist to the max. In the middle
east 'Jihads' are often murderous, so the word association game is one
where you have failed again sinplop...

Maybe one of us is watching your every move...tread lightly and carry a
big stick is my advice to you...

WINDOZE RULES! Why should they spin this? They put Atari out of
business which means there are no more significant TOS hardware. Putting
an 040 as the main processor and calling it a new computer is pretty
pathetic.

I...myself is doing my part to help the little guys that are left. Will
be building a cheap Athlon(or celeron 450) Be system for fun. There are
at least 1000 apps available with more comming. It's like being back in
the early 80's again.. Since I will be upgraded to a new annual
PB...Have the best of both worlds..

The only thing that's obvious is that you're trying to dodge the issue
of your employment. Your "clues" only reinforce your cluelessness.

BTW, it's spelled "you're". Talk about Pot/Kettle/Black.....

oh, trying to weasel out of a legitimate request, POSEUR. And those
clues only proved that you are so desparate to live your fantasy that you
have to cruise the Internet to find sites that you can claim as evidence.

Once again, PINHEAD - name of business. Name of supervisor. Phone
number and time where he can be reached. Failure to do so only proves that
you are the coward you are.

BTW, it's spelled "Quayle"

MGI Software in Richmond Hill still develops and markets Calamus SL.
MGI also is a member of CAAST (Canadian Association Against Software
Theft). They certainly would have a case if anyone was selling a pirated
copy of Calamus at the Flea Market. Howard Carson from MGI will probably
be at this flea market. And man, you don't want to piss Howard off...

I second that. I still recall the last time piracy was found and
how swiftly Howard reacted; really devoted to paying customers,
but completely ruthless against non-paying ones. Beware, TIFKAS.

Right, glad I got your attention.

Isn't it sickening to note how many posts around here are completely and utterly irrelevent to the topic of this newsgroup?

May as well rename it to "Mac, MS, and PC brownnosers unite.advocacy" given the amount of posts related to such rubbish and not to the Atari (classy 8-bit or that crappy ST line) computer.

Sorry for the harsh and unorthodox tactic, but at least you're now aware of the situation.

While I'm here, anyone want to buy a used mac or an Amiga? I also have a free retail copy of Windows 2000 for y'all! [got it?]

TORONTO ATARI FEDERATION FLEA MARKET NOVEMBER 17TH!

Yes, folks, it's time once again for users of the classic Atari 8-bit, ST, TT and Falcon computers to come to the annual event where you can divest yourself of what you don't need while at the same time hunt out for what you do! Sell your old stuff, discover a treasure!

Among other things you'll find at this event:

classic systems! Looking for that Falcon? Wished you had an STe and its expanded capabilities? Do you need a 600XL for your collection? There's a good chance you'll find it here!

hard-to-find games, peripherals, literature and applications!

TAF Software Library, carrying hundreds of PD/Shareware games, utilities applications, as well as the TAF Internet discs! Plus we'll be selling 720K floppy disks, stock up! The membership desk will also be up for renewals as well as new members.

the camaraderie of fellow Atari users - swap stories, troubleshoot, ask for advice! Meet some of the faces you've only read online on the Internet!

Ken Macdonald's demonstrations and sales of the various Mario Becroft adaptors for Ataris. Use a PC three-button mouse with the Mouse Adaptor, plug & play, works with Ataris and Amigas! Use a PC keyboard, PC mouse and Atari joystick with the amazing new QwertyX adaptor, no soldering required! Give your ST or STe amazing storage capacity with the Internal IDE Adaptor kit - program storage, add a CD-ROM, use an LS-120 internal drive to replace your disk drive! And, with the VGA Adaptor, use any VGA or SVGA PC monitor with your Atari ST to get a beautiful hi-res display!

All this and MORE!

It's a night of fun and commerce, and it's being brought on by the one, the only, Toronto Atari Federation - bringing you the best in Atari-related computer info and enjoyment since 1984! See you there!

Flea Market details:

Admission and tables for TAF members: Free
Admission for non-members - $2.00 (one thin toonie)
Tables for non-members - $5.00 (admission waived if you purchase a table.

NO STOLEN ITEMS OR PIRATED SOFTWARE ALLOWED! VIOLATORS WILL BE PROSECUTED TO THE FULL EXTENT OF THE LAW. (No matter how much The iDiot Forever Known As Sinclap will bitch and whine, fast or slow, the law's the law!)

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Those coming by public transport can take the TTC Yonge Line north to North York Centre Station. $2 for non-members. Dues are $25 per year, and includes a subscription to the newsletter PHOENIX. Membership in TAF IS Atari support!

Ken MacDonald, president: anarkist@idirect.com, 416-533-0504
Dan Dreibelbis, Vice-President: dreibel@idirect.com 416-766-4743

What are you talking about.
1) It is Atari Advocacy!
2) THerefore there is a very pro and happy Atari Side.
3) There is the entire world of enemy systems and users advocating that we
pack it in and get a newer system. OF course I would rather stick with the
better system than get something new that simply a lateral movement.

>May as well rename it to "Mac, MS, and PC brownnosers unite.advocacy" given

Actually we could call it.

sinclap.has.no.job

Newsgroup focusing on the amazing amount of time our hero has to annoy all
other platform users.

Now mind you without his mindless comments, getting the ire of many, this
place would be far duller.

Now as for the crappy ST? Perhaps you should be using software of you 8 bit
to engage in this NG instead of the MS products?

I know nothing of the 8 bit. Perhaps 8 bit users are a quite group.

But I will take my crappy ST that is now 14 years old and happily use the
1999 software available for it.

>Sorry for the harsh and unorthodox tactic, but at least you're now aware of
>the situation.

I think the readers here may be more aware of the situation than you are?

>While I'm here, anyone want to buy a used mac or an Amiga? I also have a
>free retail copy of Windows 2000 for y'all! [got it?]

Well in all Honesty, from what I am hearing is that PCs and Macs make great ST emulators. The Mac Particularly.

Mindyou my ST is still a good Mac Emulator.

As for Amiga. I am not Anti Amiga, and the users are far more humble today than when I had mine 9 years ago. I like reading the occasional Amiga user still boast that his is better than Atari. Reminds me of the First version STar Trek episode where the two men (ONE BLACK FACE RIGHT & WHITE LEFT) adn the other (WHITE LEFT & BLACK RIGHT) are the last two living men of their race and they continue to try to kill one another.

Nothing like concurrent obsolescence and two 68000 based platforms still going at it toe to toe.

For me I am against disposable technology.

My close friend and former ST user purchased a P150 in 1995 with Windows 95 installed. It had a whopping 16meg of ram (like my Falcon) etc. and cost around $2300 at the time. It is expandable to 128meg of Ram. So a few months back he went to get more ram, and imagine the surprise to find out the ram was proprietory and the name brand company doesn't supply this type any more. What a joke. I told him he had to be able to locate them, it doesn't make sense, but sure enough after much searching at various outlets no one could find the appropriate ram. Needless to say some didn't look very hard. And I am certain with my persistence I would locate the right ones. However, he is content to purchase a new computer.

My Brother just picked up a Packard Bell. This has turned into a big mistake. Let alone that after all of one months use the keys have lost all the letters from the buttons. No sooner did he try to have this replaced under warranty, he was told that this modell and keyboard are no longer supported. SO What, he wants a keyboard, give him another. Well the dealer says that this is not their problem and that they only cover the extended warranty and that this complaint would have to go to Packard Bell.

Nobody seems to have trouble selling a computer, but supporting one, that is another story. If computer dealers were carsalesman there would be alot of DEAD computer dealers, for people wouldn't put up with this nonsense if it was their car. As in Western Canada a Car Dealer was killed and the police say the problem is that the dealer made so many enemies with his broken promises and failure to cover warranty that the number of suspects with a motive is quite extensive.

later brian.

though to Mr. Robinson I may be guilty of being "off-topic", my purpose of doing so may actually be more "on". After all, the current Micro$oft situation is of considerable and important relevance to all computer users, which is why I cross-posted those announcements here.

Besides, it gives me a chance to give TiFKAS the attention he craves - but not necessarily the type of attention he wants. :) And he certainly has been taking his lumps as of late what with Particle Salad's unmasking his total complete ignorance regarding the video and film industry, as well as my unmasking about how little he really knows about what he's supposed to be selling, and why it why it's impossible for anyone involved in any way with Apple to hire him. His utmost refusal to provide any real tangible evidence as to his employment is really laughable, seeing as it would be the one thing that would really blow me out of the water - instead he continually posts URLs to sites that in no way mentions his name or position or what company he works for that any two-bit moron with access to a library computer could easily find in a web search (and really, non-disclosure agreement? that's the utmost in stupid excuses, as if he was so tightly bound by something like that he wouldn't be able to rent or buy a car, rent an apartment, buy a house, open a bank account - indeed, such a binding requirement may even violate his precious First Amendment rights).

TiFKAS' overblown shenanigans and ineptitude have been the butt of many jokes from TAF meetings all the way to Atari meets in the UK. But then, what else can I say about a man who, having run out of arguments, starts hallucinating about obese people who aren't there, or attacks the country of origin of his tormentor with his pathetic jingoism, using statistics

from easily-refuted sources.

(BTW, TiFKAS - figures are in. Canada has a $67 Billion budget surplus, projected to grow to $97 Billion in five years. Our Finance Minister is looking at tax relief in the next budget as one way to use the money. The Toronto Star has done research that shows that while Canadians pay a large amount of tax, Americans actually pay more to their government for less. Our unemployment rate has dropped down to 7.3% and is still dropping thanks to strong performance in manufacturing <read : high demand for finished Canadian goods thanks to a low dollar> and carpentry <new housing starts, which is what you get from a strong economy>. The Bank of Montreal forecasts that our economy will grow another strong 3% in the next year.

Compare that to The Daily Tubby <aka the National Post, Canada's Other National Newspaper>, TiFKAS' favorite propaganda rag that regularly chicken-littles the Canadian political climate because Conrad "Tubby" Black (a tin-pot Rupert Murdoch wannabe) really, really hates our Prime Minister, posted a $37 million LOSS in its first year of operation - gee, maybe they should practise what they preach and "adopt the iMac model" which they advocated Canada do because "the sky is falling"!

oh, and the "iMacs are sold out"? It finally happened because dealers here slashed the prices of older iMacs by as much as $500, thereby making them much less overpriced and much less underpowered, and thus more palatible to consumers, in anticipation of the new goodies Apple promised and have still to make it over the 49th parallel, as reported on http://www.macintouch.com . Hard to sell new overpriced, underpowered iMacs when you can't even supply them ;) . Of course, it's too bad Apple doesn't understand about being competitive with PCs in Canada - $2,499 for an iMac SE DV, bwahahaha.....

likewise for my Falcon. I've been using it again over the past month
and have been amazed with how much I missed its no-nonsense approach. And
with MagiC and its real pre-emptive multitasking and memory protection -
things missing from this Quadra, and still missing from the Mac OS
(probably until MacOSX Consumer, but then it's still 18 months late and
counting....)

>

I've been trying out the current demo of MagiCMac on the Quadra, and
man does this thing really go fast! And that's without installing NVDI 5
on it.

Ah yes, "Let This Be Your Last Battlefield". That was an amazing
episode let down by the cheesy backscreening towards the end. Frank
Gorshin was amazing in that, didn't realize that he could do serious work.
I've got that one on tape :)

I'm finding in my dialogues with Amiga users a spirit of cooperation
and wanting to stop the bickering. It was amazing to sit in a TPUG
(Toronto PET User Group) meeting and watch Shapeshifter (a Mac emulator)
running on an Amiga 3000. I even got in the act and showed the Amiga users
how the Mac OS worked and some of the Control panels. They were just as
interested in the PC Mouse Adaptor (which works on Amigas as well as
Ataris) Ken brought in to demonstrate.
>
> Nothing like concurrent obsolescence and two 68000 based platforms still
> going at it toe to toe.
>
> For me I am against disposable technology.

same here. I'm currently accessing an idea to put together a "Mac
Rescue Unit" to get older Macs out of the thrift shops and off the streets
and into the hands of those who would really benefit. Same with STs. I had

a nice conversation with someone who does relief work who said that there
are many needy people from around the world who could really benefit from
having a computer at home for learning and accessing information.

my mother had bought a laptop from Radio Shack a number of years ago
and ran into the same shenanigans. And the guys wouldn't just sell the RAM
to her, they said THEY had to install it. Not only that, but they wouldn't
even tell her who manufactured the RAM so she could buy it as a third
party. Even though she explained that her son (my brother) was a computer
professional who fixed laptops as well as Macs for a living, they said
they just couldn't sell her the RAM "for her own good". Is it any wonder
she decided to go Mac?

oh man, and after the announcement Packard Bell made a week ago about
their leaving the PC business, he's going to be VERY lucky to get anything
from them. No wonder those people who bought these lemons refer to the
company as "Packard Hell".

there's an urban legend going around about a man in a computer shop who
needs a particular cable and the shop keeps ordering the wrong one. He
winds up strangling the sales clerk with the cable.

Same in Europe. Even the new iMac 350 sells for twice the price
of a well-equipped PC.

> there's an urban legend going around about a man in a
> computer shop who needs a particular cable and the shop keeps
> ordering the wrong one. He winds up strangling the sales

ROTFL! ;-)

About your "rescue old Mac/ST" project, how about this:

* upgrade to the full 4 MB
* internal IDE interface and drive (with TOS 2.06)
* upgrade to HD floppy drive

This, coupled with any second-hand 28.8 or 33.6 modem, produces a
rather good machine for music sequencing and the occasional email
to the freenet using Newsie.

comp.sys.atari.advocacy? As in defined as attacking and defending Atari
in company and stuff...

> May as well rename it to "Mac, MS, and PC brownnosers unite.advocacy" given
> the amount of posts related to such rubbish and not to the Atari (classy
> 8-bit or that crappy ST line) computer.

Thats why it's called advocacy...Thats why you have comp.sys.atari.st and
the 8 bit one as well...

> Sorry for the harsh and unorthodox tactic, but at least you're now aware of
> the situation.

You want the traffic to die?

I am already way ahead of you here, as this is what I have been doing for over a year. After using a 520ST for nearly 18months for the internet, I started finding 520ST&1040ST second hand for cheap or free. Last purchase was a Mega2ST for $20.Cdn. About $12US. However I have been doing things with the older hardware and really want to adapt these Becroft devices. Since I am quite used to the bugs when using early TOS and internet, I have been giving the machines for COST to FREE, depending on what I have into them, as cheap internet computers for some people less fortunate than me.

Of course, you can find 486s and such for Roughly $50. I simply can't help out the users, so they are stuck with what I know. Besides that I can find cheap printers and supply all the other software needed. I have hundreds upon hundreds of commercially boxed software.

Even still, with the ease of use and manuals I find that helping others takes up a considerable amount of time. But as I used to run an Atari ST club in the 80s I am used to peoples questions. The only stipulation I put on the computers is that if the people find themselves not using it or getting something else, that I get the computers back for others.

Now as OLD Macs are getting to be very cheap, these may also be a viable alternative with iCAB.

Question for anyone that can answer? Can MAGICMAC run ST INTERNET software such as STING and CAB.

Regardless, there are alot of things the ST can do other than Midi. The CyberSeries although incredibly dated, can still allow alot of creativity.

>This, coupled with any second-hand 28.8 or 33.6 modem, produces a
>rather good machine for music sequencing and the occasional email
>to the freenet using Newsie.

The above set up is good for NEWsie, but is also quite acceptable for CAB with Graphics off. This is actually pretty fast and if the WEB PAGE is GOOD enough, (You turn the graphics on and WAIT;-).
(Don't bother waiting for the QFUNK PAGE, YAWN:-) But you still get the page, and all the files. You can even use CAB in Lowres with a resource

program that allows the entire menu in CAB to be available. This provides 16colour graphics (Equal to my STock TT). However I tend to use the program in HI RES and get the graphics downloaded then view them in Speed of Light ect. and appreciate the pictures even more.

Now a few things that I have noticed is that early versions of NEWsie work better with the older TOS. Particularly anything btw .86 and .90. Older TOS being TOS 1.0 to 1.2. Clearly and IDE adapter with TOS 2.6 would clear up alot. However if you have memory to spare 2.5 meg or more, then MAGIC is a good solution to the TOS problems.

I am using a Falcon STOCK at this moment and I can tell you that the speed at 28800 isn't much faster than the ST at 19200.

I just happen to be enjoying the Falcon Alot at the moment:-).

The question for the ST is how much do all these mods cost,

1)IDE
2)TOS 2.6
3)Ram + card
4)HD Floppy Upgrade (Drives can be found for FREE).
5)Serial Port Upgrade.

Finally I would like to add alittle more speed to the ST, heck even the Falcon and the TT for that matter:-).

While I enjoy messing with the ST, I think you will find that adding a number of the above upgrades costs alittle more money than you might expect if you want to give these machines away to people.

Therefore while the upgrades are all advisable, I have worked pretty much with STock STs and whatever ram they have available. I haven't tried the NEWER versions of STing with them as I have seen little need to upgade from Peters last release.

Later Brian.

10 inches? Hmmm, heres what I think...

Size is irrelevant...don't you know women judge length poorly?

Long Dong Silver (a porn star) has almost double that at 18",
but fails to 'raise the flag' due to lack of blood for both
himself and his 'weapon'. He'd black out if ever he could
raise his ardour enough to make it useful for anything more
than just a tease shot!! Therefore size can be disadvantageous!

no, not good. TiFKAS fails to realize that the humour of Beavis &
Butt-head is that they're losers who think they're cool, but they're not.
And idiots to boot. Just like ol' Sinclap...

>
> >
> > I'm using both, pinhead.....
>
> Why? Opera not good enough?

Opera doesn't run on either machine, pinhead - you need a PC for that.
Another example of TiFKAS not having enough computer knowledge that he has
to bluff it....

BTW, where IS Opera for the Mac? Probably the same fate as Half-Life....

>

oh, we did have a lead in many things. We had better search & find
utilities before Apple began touting them in OS8. And OS8 still can't
search for text in archives like Holger Weets' Finder utility for the ST
(so marvelous I paid my shareware fee after one session with it).

BTW, seems I read that there's no Java 1.2 for the Mac - how many years
has it been now? Apple still has to play catch-up....

>

even if it's a secondary role it's still a use. But the 68000 is still
a CPU chip, and it's still in use. So much for your computer knowledge.

and calling me a "dumb ass"? Just means I'm pushing all the right buttons.
You're wiggling your ears and braying.....
>
> > >

no you haven't pinhead - you just posted web sites with no mention of
your name and your position. Hardly evidence. You'd be found in contempt
of court in you tried that in a courtroom.

The only acceptable evidence - name of business. Name of supervisor.
Number and time where he can be reached.

great idea! I would put in a LS-120 instead of the floppy though.
can read/write floppies and 120 MB disks also. great for backing up that
2.5" IDE you put in the ST with the IDE board! :-)
Trouble is, upgrading an ST can cost more than it is worth, to
someone who doesn't already have one and the consequent experience,
knowledge, and software.
But this is what Mario Becroft has been diligently working on for the
past few years! He is coming out with an accelerator for the ST that
includes higher video(aka standard PC video card) and more memory-up
to 16MB I believe. Before non-atari users start laughing, that's more
than enough for almost anything you want to do. The only exception I
can think of is loading large graphic images.

As pointed out recently by Uwe Seimet, replacing the main floppy
by an LS-120 is a bad idea since, should your boot drive (e.g.
the internal 2.5") fail, you cannot boot from floppy anymore.

> Trouble is, upgrading an ST can cost more than it is worth,

That's to be expected of marginal markets.

hmmm. let me check on that. it makes sense but Rob Kuba of TAF installed
a LS-120, and I 'think' he said he can boot from it!? In any case an
external floppy drive would fix that problem immediately!!
(unfortunately not possible with the Falcon! :-(

I thought the 68000 series was dead. I did not know that Motorola was
making faster 060 chips that 50Mhz

I would love to get a ST. I am currently using Windows 98 but I am
get really tired of it. I am going back to my good ole Amiga. I
remember seeing the ST when it first came out and I loved it. I hear
it is good for audio stuff. I plan on getting into Audio technology
and would like a nice Atari for that

An Amiga is certainly not in the C64's class relative
to todays PC's. This is simply Lemming vanity and FUD.

Why not just get a BeOS system? Be is the logical sucessor to the Amiga
and ST...

No, the app is not like Quake were you do need a PPC! There are 040
machines in circulation but are no longer supported...If you want to use
OS9 and X consumer, a PPC will be needed.

> making faster 060 chips that 50Mhz

Earlier 68000 chips are on scaled down production or order only.
This inlcudes anything lower than certain models of 68030 down.

The 68060 is continuing to be developed however. Its most common
use is in embedded systems (x-ray machines, PLC controllers etc)
but of course it makes an excellent CPU dues to its inherent 680x0
architecture. 80-90MHz 060 are available now/soon. The most 'famous'
use of the 68060 was as the controller CPU's in the recent Mars
robot mission!

> I would love to get a ST. I am currently using Windows 98 but I am

A Falcon is a nice start for audio. A Hades060 with StarTrack DSP card
is apparently better (can record 16 stereo CD quality tracks of music
simultaneosuly?)...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

If discontinued stuff really was "priced to go" then I should
have been able to find Rev.D iMacs on discount, when the iMac
350 came out, but I didn't; they were _not_ discounted. Explain
that one, Sinclair? Or maybe Mr.Jobs should do it for you?

once again, TiFKAS' waster mentality comes to the fore - namely, if it
don't support the latest and greatest, it's junk.

seeing as I have no use for time wasters like Quake, I'm more
interested in the productivity side - and as I have said, there's still
plenty of third-party support out there. Third-party is better than NO
support. (And I'm finding plenty of 040 based games).

OS9? According to www.macintouch.com, it's pretty buggy, with many apps
falling over on it. OSX Consumer? 18 months late and growing later -
surely you know better than to use vapourware as an argument? Oops, you're
trying to emulate Steve Jobs' distortion field....

>

this weekend in Germany at the Atari show. With representives from
Motorola and Hewlett-Packard at the booth.

Are you going to admit you made a boo-boo about the Motorola '060?

then there are a lot of Mac users on mac.advocacy whose views and thinking
are "behind". You just insulted a whole bunch of Mac users, pinhead.

And besides, weren't you braying that Pointcast would ultimately crush
Atari as a method of getting on the internet? I do believe that Pointcast
got crushed instead :)

no you haven't - you just posted a web site that any two-bit moron
could find on a library computer. Your name is nowhere listed there.

Again, POSEUR - name of business. Name of supervisor. Time and phone
number where he can be reached. That, or an admission that you've been
living a lie for the past six years is the only acceptable answers. YOU
have to prove your credentials, YOU don't set the rules. Get Over It!

oh, you're hallucinating again - "Chunks" does not exist.

and look who's talking about being a bully - I was talking to Ken about
you last night, and it seems you were trying your usual flaming e-mail
campaigns to try to get him to back off his complaint agaisnt you to Deja.
He never realized just what a foul mouth you have - but then, after Rich
Tietjiens shared with me your bullying tactics, I'm not surprised....

OKAY Milwaukee and Madison Atari users! Here's you're chance!

Get a picture of TiFKAS with a digital camera and post it to the net
within minutes! We're all curious to see what this troll looks like and
where he lives.

Of course, if he fails to show, be sure to report that too :)

Depends on what. For mp3 decoding you might have a point.
For anything else where the OS is likely to get in the
way, the P5/200 comparison is likely more valid.

Angry Mac Man: Macintosh is the'nigger' of the computer industry
November 18, 1999
By Rodney O. Lain, lain@macsimple.com
Associate Managing Editor

American blacks have finally reached cultural maturity! They are capable of self-criticism! Comments made by a reviewer of the book Black Bourgeoisie Between me and the [White] world there is ever an unasked question: unasked by some through feelings of delicacy; by others through the difficulty of rightly framing it. All, nevertheless, flutter round it. They approach me in a half-hesitant sort of way, eye me curiously or compassionately, and then, instead of saying directly, "How does it feel to be a problem?" they say, "I know an excellent colored man in my town"; or, "I fought at Mechanicsville"; or "Do not these Southern outrages make your blood boil?" At these I smile, or am interested, or reduce the boiling to a simmer, as the occasion may require. To the real question, "How does it feel to be a problem?" I answer seldom a word.

W. E. B. Du Bois (1868-1963), from his book The Souls of Black Folk
And they asked me right at Christmas If my blackness, would it rub off?
I said, ask your mama.

Langston Hughes (1902-1967), from the poem
"Horn of Plenty," in the book Ask Your Mama: 12
Moods for Jazz (1961) They lynch Black people up North, too. They just don't use rope. Ralph Wiley, Why Black People Tend to Shout

Since I consider myself to be a black guy who seeks true objectivity in my worldview, I long ago vowed to have an equal number of non-black friends in my life to help me --unbeknownst to them -- keep a proper balance in all things racial. Since taking that vow, I've had many a late-night conversation with white counterparts. None of those conversations were ever orchestrated on my part, but invariably, as we got to know one another better, it always seemed like sooner or later I would be asked some variation of the one particular question: what is it like to be black? Like Du Bois, sometimes I heave a sigh, sometimes I wax emotionally, sometimes I say nary a single word. Sometimes, though, I

tire of being the representative of my race. After all, I am not the EveryNegro -- even though I play one on the internet. But such is the lot of an interracial emissary. My mind works in weird ways, so it wasn't any surprise that I began to draw analogies between being a cultural minority and being a computing minority. The really weird thing is that the more I thought about it, the more parallels I discovered. So I thought I'd run a few of them by you and see what you think. But before doing so, I must make a confession and a disclaimer.

THE SOCIAL CONTRACT, AMERICAN STYLE

Racial discussions tend to be conducted at
one of two levels -- either in shouts or in whispers. The shouters are generally so twisted by pain or ignorance that spectators tune them out. The whisperers are so afraid of the sting of truth that they avoid saying much of anything at all.

Ellis Cose, Rage of a Privileged Class

By the very mention of race in a public forum, I have committed a gross sin. No one will ever admit it, but there is an unwritten rule that says "thou shalt not discuss race in public." Race makes people uncomfortable. The subject of race makes Whites and non-Whites uncomfortable when addressed in "mixed company" -- that is, when the audience is made up of people of more than one race. Oh, it's okay to discuss race when everyone is of the same race (or of the same opinion), but don't you dare do it where it may cause serious and prolonged discussion! Wanna make a crowd disperse? Bring up race as a serious discussion topic. There is another reason people don't like discussing race: it causes Whites to feel pangs of white guilt" (and no one wants to feel guilty), and it causes Blacks to feel racial anger, which exacerbates the White guilt trip -- yes, Blacks can be racist, too.

Now, there is a reason I use the Black-White race relationship as an analogy for Mac/PC "race relations": the White-Black race relationship is the quintessential race relationship. It's the most written-about race relationship (as Ellis Cose says, the libraries' bookshevles groan under the sheer volume of texts written on the subject).Therefore, to discuss race -- in America, anyway -- is to discuss Whites and Blacks. To discuss OS "wars" is to discuss Mac and PC, apologies to my friends who use Linux and other flowering platforms.
Allow me to get colloquial and ask you: knowhutI'msayin'?
By discussing race, there are some of you who will never read my column again. I take that chance, because I feel that certain things must be said. Some of you will call me a racist because you will either misunderstand what I will say, will not read past this column's title -- or I will not express myself clearly. But that's okay.
I ask you, though, to read this column in a vacuum. Don't let it color -- no pun intended -- everything else that I will write or will have written. Just remember that I always bow towards Cupertion and seek Higher Guidance through "The Columnist's Prayer," created by the late

Lewis Grizzard, a Great American:

Oh, Lord, I thank thee for today's column
And I ask thee to forgive me for
yesterday's.
I am trying not to whisper nor to shout. I'm just trying to discuss
calmly two subjects that are close to my heart -- for obvious reasons.
End of preamble. On to my unabashedly biased presentation of the
parallels between Blacks and Macs (and Mac users).

BOTH FEEL OPPRESSED BY "THE MAN"
I just received an e-mail today from a reader who told me to quit
bellyaching. He said that all Mac users do is complain about being
slighted, and that there is nothing to complain about. This is the exact
same thing that many American blacks are told. They are told that
they have it better than they realize, so why gripe?
That is one reason why I don't vent my racial gripes anymore. If you
begin to point our racism and prejudice, even when your indignation is
justified, even when the racism/prejudice is blatant, embarrassing and
harmful, you will be ostracized for having broken the aforementioned
unwritten rule. On the Mac side, Mac users should want to be judicious in
their talking about the way Mac users are treated, for similar reasons.
For example, one place where I worked, mysupervisor walked up to me and
said, "you must feel like you're in hell, since all we have
here are PCs." I had no idea where that comment came from. Little did I
know but many people in the company had passed around the fact that I was
a Mac head and some had even read one of my columns (I'd given one to my
interviewer as a writing sample) -- it was an all-PC environment.
From that point on, there were always disparaging remarks made in my
presence aboutMacs with the purpose of getting a rise out of me.
After that, I began to take my PowerBook to work. If they're gonna piss
me off, I figured, I guess I should piss them off, too (my NT machine
never worked anyway, so as the MIS guy fixed it, I got work done on my
Mac). On the Black side, I remember working at another place alongside a
friend with whom I'd been involved in one of those Christian mens' groups
where you confess your problems, etc. I was idiot enough to confess that
I spent many times being self-conscious about livingin Minnesota, easily
the "Whitest state in America," Montana notwithstanding. After that,
the "friend" began saying things in mixed company that would appear
obviously meant toembarrass me. I remember one day, we were trying to get
something fixed, and he commented that we need to "nigger rig" it.

BOTH ARE OVERLY SENSITIVE
I've spoken with Mac user after Mac user who is
upset about the fact that CompUSA never has any Mac software or never has
this or that Mac product -- sometimes I tried to point out that the Mac
isn't the only computer sold in the store, and that managers have to deal
with reps from Intel, Compaq, etc. and that the Mac is just one out of
many, so no offense should be taken.. I've been with Black person after
Black person who complains about some real or imagined "racism" --

sometimes I try to point out that there is a difference between racism andprejudice. Black people make a big thing about their culture and demand that it be recognized, to hell with other minorities. A prime example is Black History Month and Martin Luther King, Jr., national birthday. I think Black America needs to rethink this ethnocentrism -- but don't give up on supporting their cultural heritage. Mac users make a big deal about anything having to do with Macs, to hell with people who are equally passionate about Linux, the Amiga, the Commodore, etc. We need to chill.

BOTH CAN BE THE BIGGEST BIGOTS ALIVE

Negroes can be fascists, too.

Richard Wright (1902-1960) African-American writer

If White people wrote the book on racism, as some blacks are fond of saying, then Black people studied the book and perfected the technique described therein. Mac users are proud of their ability to bash the PC and Windows. Then they are quick to point out the the PC world is biased towards them...

BOTH ARE SEEN AS INFERIOR
Fifty-three percent of nonblacks believe that African-Americans are less intelligent than whites; 51 percent believe they are less patriotic; 56 percent believe they are more violence-prone; 62 percent believe they are more likely to "prefer to live off welfare" and less likely ot "prefer to be self-supporting."

From a 1990 survey

How many times have you been told that Macs are worthless? The Mac isn't a "real computer"? The Mac isn't good for anything but graphics? I arrest my case (on this point, anyway). HAVE TO WORK TWICE AS HARD TO BE CONSIDERED HALF AS GOOD Okay, I know this is a stretch: Apple advertises the G3 as being "up totwice as fast" as the Pentium II. They advertise the G4 as being 2. 9 times as fast as the fastest Pentium III. Meanwhile. Windows users (White people?) don't even attempt to stifle their yawn, instead, they exaggerate.

PERPETUATED MYTHS
The Mac is supposed to have huge speed differences beyond the PC (you know, up to twice as fast)' Black men are supposed to have huge' oh, never mind.

MANY OF THEIR PROBLEMS ARE OF THEIR OWN CREATION
I grew up a liberal. I became a conservative in college, and now I'm a thinking person. I see right and wrong on both sides of the ideological fence. The reason that I came to eschew both liberal and conservative notions of race is because I came to see flaws in both sides' racial remedies. If you agree totally with (fill-in-the-blank with your political affiliation), then you're not thinking. I came to see that if

we applied nothing but the consevatives' bootstrap theology to Blacks' plight, there would still be the issue of instutionalized racism to deal with (it does exist, whether you agree with me or not). If we applied nothing the liberals' welfare/government intervention stategy, there would still be the issue of dealing with Blacks that depend too much on others and not enough on themselves.
The same is true for the Mac. Many PC users feel that Apple needs to shut up and make quality products (read AGP, TCP/IP, multitasking, preemptive memory protection, yada yada yada), then the Mac'd give Wintel a run for its money -- but what about the MIS people who have their job security to nurture? Then there are those who think that the government should break up Microsoft to allow alternatives Oses a chance to compete -- but what if Apple is subsequently proven to be a monopoly in its own right? (Again, I know this part of the analogy is also a stretch.). I could come up with other comparisons, but I know many of you are probably tired of me talking about race (then again, maybe not -- those who can't handle this have probably stopped reading long ago, even ifthey'd gotten past the title).

BOTH ARE MORE INFLUENTIAL THAT THE MAJORITY WILL DARE TO ADMIT

Without the presence of blacks'. Huckleberry Finn would not have been written'. [There] would be no Faulkner; there would be no Stephen Crane'. no Hemingway' even our sports would be lacking in the sudden turns, the shocks, the swift changes of pace (all jazz-shaped)'. Since the beginning of the nation, white Americans have suffered from a deep inner uncertainty as to who they really are'. Many whites could look at the social position of blacks and feel that color formed an easy and reliable gauge for determing to what extent one was or was not an American. Perhaps that is why one of the first epithets that many European immigrants learned when they got off the boat was the term "nigger" -- it made them feel instantly American'. Despite the racial difference and social status, something undisputably American about Negroes not only raised doubts about the white man's value system but aroused the troubling suspicion that whatever else the true American is, he is also somehow black.

Ralph Ellison (1914-1994),
"What America Would Be Like Without Blacks," from Going to the Territory

The Mac has brought many innovations to the industry. The Mac is not only a part of the trend setters among the industry, but a part of popular culture (notice the growing number of Macs on TV?).
Blacks have influenced American culture more than any non-white culture. Jazz is the only music considered uniquely American. Over 2/3 of people that buy rap music are white. Every child athlete probably wants to "be like Mike" at one time or another. Black culture has influenced language and customs more than anything. How many of you give each other "high fives"? And how about "talking trash"? The use of slang could be a dissertation in itself.

CONCLUSION: DISCUSS THIS AMONG YOURSELVES

All analogies break down, and so does this one. I do not think this analogy is airtight, nor should it be carried out to its logical conclusion -- it is obviously untenable in many respects; for example, I would not try to argue nor would I agree with the fact that, say, Linux is the, uh, Russian of the computer industry. So, extrapolate at your own risk. Take this in the spirit of satire in which it was given (with a touch of seriousness). I�ve been trying to come up with an appropriate name for the column that I write here at Mac Simple, and I think I�ve found it, in light of today's column: Angry Mac Man. Yep, that�s me to a T. It has the ring that I want, and it has a play on words, which I love. What do you think? Comments are welcome, and I even respond to flames. Don't worry about I'il ole me. I can take criticism. "My People" (Mac people) have been criticized for years and years, yet we persevere. We have a thick skin created from years of being �buked and scorned. We Mac people shall overcome. We always do.

sinclap here

Looks like 'Chunks' has some explaining to do. He states that the Milan is a success due to having sales of 50 units per month which will drive the software developers to trip on each other to develop for this marvelous machine.

However, users have reported stability issues...Whats the real story here? Matt Drudge has some free time due to his spat with FOX to invistigate...Enquiring minds want to know...

Subject: Re: Milan or HADES
Date: 1999/11/17
Author: Matt Jaap<mjaap@atari-computer.de>

In article <xRhX3.328$3Y2.389@198.235.216.4>,
madmax@bfree.on.ca (Brian Van TIlborg) wrote:
Which one is the future and which one appears better.
Pros and Cons would be appreciated.
Are they reliable, etc.

The main pro for the Milan is obviously the price: it's much cheaper. On the other hand many Milans tend to be pretty unstable (hardware- wise) while others run perfect. It's now my second Milan after the first one was so unstable that I could hardly use it. The second one still likes to crash but is a bit more stable. So definately wait for the Milan II because it seems that the new manufacturers are more professional than the old ones. Hades was a nice machine but it's only a question of time until the machine is finally dropped.

Greetings,
Matt.

I am interested in knowing how the last TAF meeting went.

Items for sale. Demonstrations
# of people who managed to attend.
Unfortuneately I had to work that evening.

later Brian.

yep, Roger Sheppard. He lost his account after his unfortunate describing of Australians using a racist epiphet. Like you're about to.

Seems both Rodney and TiFKAS have some issues to deal with. Just like TiFKAS' rabid hatred of feminists. A brain virus they inadvertantly caught from Axl Rose?

"If you don't have a problem with homosexuals, then don't call them "faggots". If you don't have a problem with black people, then don't call them "niggers". Personally, I have never met a "nigger" in my life. Peace".

- Vernon Reid, guitarist with Living Colour, responding to Axl's crybabying "I'm not a racist" over the song "One In A Million", which is indeed racist...

TiFKAS, rather than face the issues of his non-employment, is using his ol' diversion tactics again to dodge the issue.....

how can he, when your imaginary friend doesn't exist?

He states that the Milan
> is a success due to having sales of 50 units per month which will drive
> the software developers to trip on each other to develop for this
> marvelous machine.

it's already happening, pinhead! ASH decided to release an improved
version of CAB (2.8) in response to the Milan's success. Hewlett-Packard
is adding support peripheral wise. Expect more to follow now that Motorola
is helping in the manufacturing and distribution end.
>
> However, users have reported stability issues...Whats the real story
> here?

you'll notice that one person's opinion causes TiFKAS to become all
excited and claim the sky is falling! There's quite a few Milan users
posting to comp.sys.atari.st who are quite happy with their machines.
Also, Milan gMBH has been pretty quick in coming up with solutions in new
operating system patches and even replacing the machines.

Of course, TiFKAS, when faced with the problems that new iMac and iBook
users have had happening with their machines regarding things not
working(in the case of the iBook, flaky keyboards and the fact the machine
turns on when you close it; iMac DVs won't save streaming video in 16-bit
mode, and many cameras on the market won't work with it), will ignore this
or downplay it. (It's all on http://www.macintouch.com for the little
wienerhead to peruse)

Matt Drudge has some free time due to his spat with FOX to
> invistigate...Enquiring minds want to know..

yep, he needs to find out how a little loser with no life who can't
even spell "investigate" is too chicken to show any evidence of his
employment.....

"and the fake Apple Power Rep can be identified by his high-top
sneakers and foul mouth".

4542. iBooks - stability problems?

Newsgroup: comp.sys.atari.advocacy
Date: 1999-11-21 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <dreibel-2111991202270001@ts7-53t-18.idirect.com>
Source record: 2507

from comp.sys.mac.advocacy:

so TiFKAS is making a big thing about early unstable Milans. Maybe he should look to the company he shills for about infinitely worse, CURRENT problems with the all-singing, all-dancing iBooks:

November 19 - My iBook died yet again - a third time. I've become totally disillusioned with Apple. I was just about to buy a G4 with 14' Display for $5200. But f*** Apple. I have had 5 Macs, and still own 3. And I'm starting to think about non-Apple products. Here's my letter before the third death of my iBook: (And they still never replied to this letter.)

Dear Apple Computer

November 14, 1999

My iBook died again - less than a week after I got my iBook back from repair in Texas. So I am shipping it back again. I was disappointed there was no explanation as to what the problem had been (still is, obviously) and what repairs were made. There should have been. I couldn't even find it in your computer records over the telephone.

I have the feeling that I spent $2000 (iBook plus 128 RAM) just to have the privilege of being a Beta Tester for Apple for a product rushed to market before it was ready.

The same thing happened many years ago when I got the very first Powerbook 100 - immediately going off for repairs for half of the first few months.

I don't appreciate paying to be a Beta Tester, and I have lost all faith in this unit. I need a dependable computer. I suppose I made a big mistake and should have gotten a G4 from The Apple Store instead, since home units are much more stable systems.

Sincerely,

William R. Noack

That makes it an efficient OS wich makes the computer feel faster, but the
number crunching performance of the CPU is still only at P75 levels.

How much of the typical desktop load comes under the heading
'number crunching'? There's a reason mere mortals aren't
clamouring for 8x SMP boxen or parallel multiprocessing clusters.

Once you get beyond supporting OS & BloatApp cruft, end user
needs are actually quite minimal (games excepted).

My prime motivation for no longer running a 486 is access to
PCI slots. Without games to waste cycles with, I wouldn't
have any motivation to run anything faster than a P5/75 really.

Clutching the straws here arn't we...

Lets see...Apple has shipped tens of thousands of iBooks according SJobs.
The standard three percent or less will have some gliches...

The Milan is more noticeable when many out of a batch of 600 that will
have shipped this year is not good.

----------here's a holiday tibit...

iBook is Number One Selling Consumer Portable in U.S.

CUPERTINO, California—Nov. 22, 1999—Apple's blueberry iBook® is
the number one selling portable
computer in the U.S. retail market in October, according to the
most recent monthly hardware report by PC
Data. The complete report is available at www.pcdata.com. Based on
this report, the combined sales of
Apple's iBook and PowerBook® portable computer lines give Apple®
an 11 percent share of the U.S. retail
portable market in October.

"iBook is clearly hitting the mark with consumers," said Stephen
Baker, PC Data senior analyst and director
of Hardware Research. "iBook sales momentum heading into the
holidays appears very strong."

"iBook is the first portable designed expressly for consumers and
students," said Steve Jobs, Apple's
interim CEO. "Customer response has been incredible and we are
working hard to meet the tremendous
demand."

iBook features a 12.1-inch TFT display for super-crisp images and
video; a PowerPC G3 processor for

Pentium-toasting performance; built-in 56K modem and 10/100BASE-T Ethernet networking; and a built-in
USB port and CD-ROM drive. iBook is the first ?wireless ready? portable computer, with two built-in
antennas and an internal slot for Apple?s AirPort? wireless networking card (optional). With AirPort
wireless networking up to 10 computers can share one Internet connection at speeds up to 11 megabits per
second and distances up to 150 feet (half a football field)?all without wires. iBook?s design innovations
include a rubber-coated translucent enclosure for durability, a pullout handle for safe carrying, and a unique
?latch-less? closing mechanism for faster and easier access.

iBook is available in the U.S. through Apple Authorized Resellers including CompUSA, Computer Stores
Northwest, Inc., Computer Town, ComputerWare, DataVision, Fry?s, J&R ComputerWorld, Micro Center,
RCS and Sears as well as hundreds of Apple Specialist stores and online through The Apple Store?
(www.apple.com).

About PC Data
Based in Reston, VA, PC Data has been providing point-of-sale data since 1991 and has become the only
comprehensive source of software and hardware sales information. PC Data supplies sales information to
more than 800 software and hardware firms, which account for nearly 95 percent of total computer industry
sales. The company?s latest initiative includes PCData Online, an Internet monitoring service
(www.pcdataonline.com). In addition to tracking software and hardware sales through retailers, PC Data also
tracks sales through educational resellers, corporate resellers and distributors.

About Apple
Apple ignited the personal computer revolution in the 1970s with the Apple II, and reinvented the personal
computer in the 1980s with the Macintosh. Apple is now recommitted to its original mission?to bring the
best personal computing products and support to students, educators, designers, scientists, engineers,
businesspersons and consumers in over 140 countries around the world.

Nope you said that. All I stated is that 040 folks will be severly
limited in choice and capability. Apple stopped producing 040 machines
five years ago you know...

> seeing as I have no use for time wasters like Quake, I'm more

The small productivity apps or utilities should be 040 friendly. But
still limited.. Many Quadra users are upgrading daily.

> OS9? According to www.macintouch.com, it's pretty buggy, with many apps

When there is a major OS update, some software will break. But the
software updates will be available asap with a patch download.

Is this the best you can do Chunks?

OK, they are really discontinued in your town, good.

Now, where's your explanation as to why remaining Imac 333 stocks
are _not_ discounted around here, despite your previous statement
that discontinued models get "priced to go" to make room for new
models?

I've got a 486 with PCI slots...it's got ISA _and_ VL-bus, too...
;-)

When I got my 486 those kinds of boards were pretty universally panned.
By the time that I got a PCI board, 486's weren't worth bothering with.

and even funnier, why all of a sudden 333 mHZ iMacs (which are supposed to have disappeared completely from shops according to TiFKAS posting pro-Apple drivel) have appeared at Computer City priced at fire-sale prices ($1,199 Canadian - do the math, TiFKAS).

actually, stay tuned - at THAT price, the iMac has suddenly come very close to my personal price point. I just might go for one now, despite TiFKAS' idiocy...

Where does Computer City still exist?

They got bought out in my neck of the woods. It was a shame
too as Computer City was the best computer chain in my area
before they were liquidated.

Keep in mind that the Loki Games (linux) will be supporting
the PPC as well & even ATI is coming around wrt Linux driver
support.

> the speed of the same clock speed of a PII!

Oh dear, TiFKAS is trapped in the Steve Jobs Reality-Distortion Field(tm) again.

well, to show AGAIN why TiFKAS is licking Steve Job's boots, here's the list of comparative tests AGAIN showing that the Jobsian claim of "twice the speed" (based on flawed Bytemarks optimized for a 486) is so much codswallop.

Please note that even a Celeron kicked an iMac's little plastic butt....

we totally expect TiFKAS to scream that it's all a conspiracy by PC people jealous of the iMac - when it was really stepping up to the challenge that Jobs threw down without showing real hard numbers (graphs without numbers are not evidence).

and speaking of "no evidence" - TiFKAS has yet to post ANY evidence that he's really an "Apple Power Rep" (and if he's so smart, how about he show us exactly WHERE he's mentioned on the Apple Power Rep home page he keeps throwing up as evidence).

Oh, and BTW - the PC industry revolves around the PIII and Celeron, not the out-of-date PII.

On 25 Aug 1999 13:24:33 GMT, glhansen@steel.ucs.indiana.edu (Gregory L. Hansen) wrotf:

>to modern Macs or PCs, or run software jobs that take long enough to time.

Integer BYTEmark (what Apple uses for its bogus claims) doesn't even
predict Photoshop performance as well as SPEC does IMO.

I've posted my laundry list many times, but I'll post it again.
Recognize that these data have been collected over a long period of
time (thus, different OS versions) and there are no data (AFAIK) for
the 450 MHz G3 vs. the 600 MHz PIII and/or 650 MHz K7. IMO, however,
the results generally reflect SPEC fairly well when compared over all
applications.

I'll be glad to update my list if anybody has any newer data. I only
post non-overclocked, non-server application data for Mac OS vs
Win9x/NT.

Quake: PII 2% faster than G3
Unreal: PII 92% faster than G3

http://www.xlr8yourmac.com/games/UNREAL/yosemite.html
400 Mhz G3 vs. 400 Mhz PII (both with Rage 128)
(old drivers for PII; beta drivers for G3)
Unreal (32-bit color)
640 X 480: G3 44% faster than PII
800 X 600: G3 15% faster than PII
For comparison:
The scores at Freak! for Unreal on a 300 Mhz K6-2 with
Rage 128 (http://9-muses.com/freak/reviews/xpert128_3.shtml)
were higher than those listed at xlr8yourmac for the 400 Mhz PII:
640 X 480 (32-bit): G3 17% faster than K6-2
The scores at Tom's hardware for Unreal running under
beta Direct3D on 400 Mhz PII with Riva TNT
(http://www5.tomshardware.com/releases/98q4/981007/index6.html)
were higher than the 400 Mhz G3 with Rage 128
640 X 480 (16-bit): PII 20% faster than G3
800 X 600 (16-bit): PII 15% faster than G3
suggesting xlr8yourmac did not use Direct3D drivers for the PC.

Tom's Hardware and xlr8yourmac also report Voodoo2 scores:
640 X 480 (16-bit): PII 17% faster than G3
800 X 600 (16-bit): G3 24% faster than PII

http://www.ars-technica.com/reviews/2q99/g3-350/g3-350-7.html
http://www.ars-technica.com/cpu/2q99/simd-shootout-7.html
Unreal frames/s (Rave vs. Direct 3D; both with ATI Rage 128)
350 Mhz G3 vs. 500 Mhz PIII

640x480 (16-bit): PIII 60% faster than G3

Plus, SPECint95/fp95 scores:

(http://www.spec.org/osg/cpu95/results/res99q1/)
(http://www.spec.org/osg/cpu95/results/res99q2/)
(http://www.intel.com/procs/perf/pentiumIII/productivity/specint95.htm)

Axro have contacted Milan GbR BECAUSE of the Milan I. I'm sure software developers were oh-so-keen to develope for the iMac with it's crapy mouse and a crap keyboard and a speed which feels almost like a MegaSTE running MultiTOS 1.0. A good example for the poor quality of the iMac is you: hey, an algorithm which couldn't even produce a single good sentence in English language!

>

Uh, but I wonder why Apple updates the MacOS so often - is it because of innovation? No! People often wonder if the next version is more stable than the previous one but then it's sure that Apple will deliver OS 9.0.1 which has other problems, crash with your fave programs...

I'm pretty sure that Milan II will kick the iMac's *** . Milan II's will be sold in over 2000 stores in Germany alone with companies such as Motorola, Creative Labs, Logitech and Axro supporting it. And you'll not need a system update every two weeks!

Milan have learned from their experiences but I can't say this about Apple!

nope, I NEVER said that. I OWN a Quadra 950 and am VERY pleased with
it. YOU, on the other hand, have constantly belittled older Macintoshes
and would rather see them in landfills than have them go to people who can
truly use them like schools...

But many people still have Quadras and are still being productive with
them. I subscribe to Quadlist, and there are a LOT of people still using
them.

again, trying to weasel out of the fact that you're advocating vapourware?

I would say, though, that some of the major programs are crashing.
Really, Apple should have allowed a proper amount of time to make sure it
was stable before releasing it. Read the reports about how unstable it is
at MacAddict?

of course it's supposed to look like that - it's a major North American
city, pinhead! What did you expect it to look like, igloos and Inuit?

Toronto is considered one of the safest and cleanest North American
cities, and is world class.

ah, a result of what happened when inCompUSA bought them out no doubt.
They really didn't want anyone around who'd show them up for what clowns
they are :)

the Canadian Computer City stores weren't part of the deal with
inCompUSA, so they were spared. Actually they're doing quite good now -
the one out in Etobicoke is really nice, friendly staff and knowledgable,
and they have an excellently laid out Mac section. They're nationwide up
here

I think the reason the 333mHZ iMacs came out at fire sale prices is
that they got in the E-One at $1299 CDN (you know, the one that Apple is
so scared of that they got a court injunction against it in Japan - and
all EMachines had to do to get around it was to change the case cover!)

I'll take that into consideration you bet. Actually, the thought of having a Mac that'll be fast enough to do Atari under emulation is one of the main considerations :). I'm looking into the printer situation (I bought an Epson last summer and I want to see if it'll have a driver for the USB adaptor they sell) and SCSI adaptor before I take the plunge :)

There is an ST emulator for Unix called STonX. It requires
access to GEM ROMs but those can be had quite readily if
you look a bit. I haven't looked at it in a while so I'm not
sure how well it exploits system services (like priters).

4563. new Milan specs. TiFKAS Eating Strained Spinach!

Newsgroup: comp.sys.atari.advocacy
Date: 1999-11-24 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <dreibel-2311992156310001@ts7-45t-20.idirect.com>
Source record: 2528

well, hello folks, and welcome to another thrilling episode of "Making The idiot Forever Known As Sinclap Look Like A Complete Schmuck"!

when we last left, TiFKAS was making a big thing about the new Milan would be buggy, have no software support, and have very little in the way of hardware support.

WRONG AGAIN, Cream-Of-Asparagus Breath! Here is a report from the Atari show in Hanover (yes, TiFKAS, they still have Atari shows in Hanover - too bad Apple can't show up for an Apple-related show in Britain!) that puts paid to the notion that TiFKAS has any inkling about Atari clones, and shows why the new Milan will be having a very good future as an alternative to overpriced, underpowered iMacs.

Of course, TiFKAS will respond with his normal tactics, including denial, dodging the issue, and of course responding to imaginary fat people who are merely a projection of his own vile personality :) Oh yes, and pretending to be an "Apple Power Rep".....

here, from http://bengy.atari.org , is the REAL story.....

Below is a slightly edited copy of a post
in news:fr.comp.sys.atari by Frank Dopierala

'On Saturday, the 20th of November, there
was an ATARI-Fair in Hannover (Germany). The environment was very poor (a cold warehouse atmosphere) but I returned extremely positive, because the Milan II was presented by AXRO, a huge distributor for media concerning to Ink-Printer, Laser-Printer Copiers etc. Hewlett Packard(!) was even present. The news is that (I talked about an hour with the representative of AXRO), that the Milan II Standard equipment (!) is the following:

Hardware

ATX-Tower

MC68060 with at least 66Mhz, 80Mhz is under construction

64MB-SDRAM (with full Bus-speed access at 66/80Mhz!!!!)

HDD: at least 10 GB (maybe 15 GB)

SoundBlaster SB64 PCI

ATI Mach 64 with 4MB Videoram, expandable up to 16MB

2x IDE, 3x serial, 1x parallel, 2x USB (hot plugging!), Keyboard,
PS2-Mouse

3x ISA-Slot, 4x PCI-Slot (2 PCI used for graphic- and sound card)

TEAC Floppy 1,44 MB, 40x CD-ROM (Cyberdrive)

Software

The Milan II is shipped with only ONE Operating System(!): Magic with Jinnee!!

NVDI

Iconnect with Draconis Internet-Package (Browser, eMailer, Chatter,....)

Pixart, Smurf SilverEdition, Photoline

TempusWord 4 or papyrus home (is not decided yet)

Texel home

A coupon to get CalamusSL for 199,- DM (app. 100,- Euro) instead of 999,- DM (500,- Euro)

COMA (Communication Manager for Fax and Voicemail)

Games: RunningMilan, Impulse (New Milan-Special games), some more games are presently programmed by third-party.

Developing-Systems

GNU C/C++, ACS-Pro (new Version for GNU C/C++), Object Gem, Bubble Gem, OLGA, UDO, UDO-Shell, ST-Guide, Omikron-Basic 6 (NEW VERSION!!), Face Value

Now the sensation

The system with configuration listed above shall be sold for 1699,- DM!!!! (App. 850,- Euro)

I asked them what HP is doing there and they gave me the answer that HP is supporting AXRO with ALL products HP is actually producing (Printer, Scanner, Streamer etc.) for developing driver for the whole product-palette of HP to run with an Milan II.

Another very positive news

The Milan II is COMPLETELY assembled at MOTOROLA!! (That's why the System can be sold at this low price!).

The Milan II is presented to the wide market on next CeBit in Hannover and AXRO told me that there will be a very aggressive marketing on it, because AXRO noticedthat the number of users working with Windows-Systems, that are extremely angry about Microsoft about their huge, slow and resource eating Programs is permanently growing and growing. And they have theopinion that if the huge mass of users (except ATARI-Users) would know that there is a system that can be a good alternative of their work, they

would buy it, and I agree in that!'

That's still a woefully out of date PC by current standards.
Also, anything you don't need done in realtime can be relegated
to a batch queue. Even on a P5/233 this is certainly the case
for mp3 encoding as I know you can't do that in realtime on a
mere Pentium.

Scanning is IO bound & bound by the speed of the scan head.
Any editing tends to be user input bound. This is very likely
the case for your own image editing operations.

>Hmmm - Milan is still vapourware in Canader

Good Day eh! The Milan is not Vapourware. It is available. If a product is announced and then not released it is considered vapourware. Something that both Atari and Microsoft were masters of in the 1980s. What you are saying is that there is no distributor for the Milan in Canada and I believe the USA. This does not mean it is vapourware, it means it is unavailable.

Now if I were to announce that I would be importing the Milan and selling it in the near future but never did, then this could also be considered vapourware.

If you want a Milan II simply order one. I may well being doing this in 2000.

Been playing with Windows and I am both impressed and depressed with it. But I Like the Atari TOS and Geneva as well as Magic. Mint is my next project followed by linux.

The more I read the Mac Advocates post the less I want a Mac. Much like having to listen the mid 80s Amiga Users who talked more than they used their computers.

Finally, I don't doubt there are horror stories on the Milan. I also have no Idea how Milan deals with these problems. From the posting that I read, it appears that they replaced the defective product for the person in question.

The purchaser of Apple computers are just as much at risk as anyone else when it comes to reliability and customer service. My perspective is "the entire computer industry and support suck". It always has sucked and I don't envision it ever getting better.

Its a dogs breakfast out there.

Just by a computer and be happy.

Later Brian.

Because of the costs involved perhaps?. With the basic stuff I do, like scanning and editing photos, making the odd MP3 and a lot of web stuff, I certainly do appreciate that a P200 (233 in my case) is faster then any 68k.

I would consider my uses to be fairly minimal.

> Once you get beyond supporting OS & BloatApp cruft, end user

Why does everything HAVE to be at the 'current' standard? If everyone
was at the current standard there would be millions of PC users who
feel so compelled to upgrade that they would need to every few months.
ALL of them would be COMPLETELY BROKE, because all their hard earned
cash would be spent on upgrading!! If motorcars had the same 'lifespan'
I'd never buy one...

I'm sure a 66MHz 68060 would be very snappy (scuse the pun!) for a
scanning snaps too. Much Atari software is written to go as fast as
possible on 68000, and maybe 68030. When run on a superscalar beastie
like the 68060 it will fly...no question! Example: 24hr POVray render
on a TT (68030+68882@32MHz) is cut to 16 minutes on a Hades060...90
times faster!

> Scanning is IO bound & bound by the speed of the scan head.
> Any editing tends to be user input bound. This is very likely
> the case for your own image editing operations.

I regularly create 30-40 Meg scans on a 200MHz Powermac 7220 (603e). I
think the speed on this is fine, so why get a G3 or G4 when I can still
achieve the same result and not be unhappy with the amount of time taken
on the 603e?

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Hi!

They did mention a type of Falcon compatibility card for the Milan, what has become of that?

I didn't state that it had to be.

Although, the market treats them that way. Software will
tend to want to exploit more RAM or more CPU or more disk
than you have. Hardware upgrades will become harder and
more expensive as old interfaces tend to be phased out.

You should see what the latest Ultima does to a Dual PII/400.

A 33Mhz 040 or 030 would likely do as well.

>possible on 68000, and maybe 68030. When run on a superscalar beastie

Why are you bothering with this example? Rendering is not
a realtime activity. Who cares?

>I regularly create 30-40 Meg scans on a 200MHz Powermac 7220 (603e). I

That is quite easy to do. Although that more demonstrates
the need for more RAM rather than more CPU. I've heard of
TT owners that had more RAM than my current (new) PC does.

>think the speed on this is fine, so why get a G3 or G4 when I can still

in what way?

if you mean regarding doing hard disk recording, the StarTracks PCI
board originally designed for the Hades will work in the Milan. There have
been some good reports that Cubase Audio Falcon works on the new Milan
with this card.

experiences but I can't say this about .

Sold in over 2000 Stores? Never in Ataris history in North America did were STs sold in 2000 STores. I had a listing of 800 STores and once Atari boosted the list including LYNX DEALERS and Portfolio Dealers.

THat is truly an Amazing Number.

I had an Article that stated in 1986 Atari Had shipped over 100,000 units. What was not told to the developers and users that less than 17% were sold in the USA & Canada.

It sounds like the descendents of the TOS platform is STable in Germany.

This is promising to me as I have no intention of leaving my Ataris Anytime soon:-).

Later Brian.

P.S. How can an 060 based machine kill an iMac with its faster chips? The 060 is pretty old?

Double Later Brian:-).

OK. I'll let you off on that one. You DID comment that a 200-233
MHz Pentium is woefully out-of-date so I assumed you meant it was
an upgrade case...

> You should see what the latest Ultima does to a Dual PII/400.

There are MANY upset PC owners who now own this CPU hog of a game, and
are not getting any more than 10-20 fps...

I haven't seen a Pentium 200 do POV-ray renders any more than about
70-80 times the speed of an 030/882 based TT...someone claimed that
the 60MHz 060 was equivalent to a P75? I think not!

> >I regularly create 30-40 Meg scans on a 200MHz Powermac 7220 (603e). I

There is only 32MB of the real thing in this Mac, its using only a
standard ATA/IDE disk, yet its fast enough with scanning for my
liking...the swap file needs a good thrashing but still it chugs
through the task...

> >think the speed on this is fine, so why get a G3 or G4 when I can still

Of course a G3/G4 will be faster, but I'm one of (I believe) a select few people on the planet who can be happy with where I'm at! Most I see are always clamouring for something faster, mainly because they've been misled into believing their current 'now' to be old hat...

Have not ignored it.. But Apple will ship millions of units.
Unfortunately, some will be flaky. But when a firm is going to ship 600
Milan's a year, than the handfull becomes an issue and a loss in P&L.
According Fred A, Apple's warranty expenditiures have declined in Q4 over
the corresponding periods..

Improvements. Instead of a over promised humongous OS release, Apple has
decided to add the features when ready in steady OS releases. About two
times a year. I guess it's acceptable in the TOS World when a new
release is every sixth summer..

Sounds like sour grapes...

I swear that Mac OS 9 was released on Oct.23 which is way more than two
weeks. So Apple should of been like Atari? Maybe someday there will be
an update...Real soon now...

No...The iMac DV line is the culprit. According to the Court, the maker
of the e-One fringed on Apple's iMac look. I'd be pissed if I took the
market risk in a new design and have schmucks who are trying to get a
free ride.

Ahh... the eternal hardware brag.

Sure, on PC, where you need the latest hardware/os to run even a
simple word processor, the numbers count.

However, the real cojonas show when it's time to compare how much
hardware you need to run similar applications at similar speeds.

This is where Atari shines: "obsolete" hardware running similar
applications faster than their PC counterpart at faster specs.

A 100,000 is like a needle dropped in a haystack.. Cause Atari did not
inform the American public and the productivity software was not as good
as Lotus and WordPerfect plus Claris.

> > How can an 060 based machine kill an iMac with its faster

unfortunately, pinhead, it doesn't help when the keys actually fail and
fall off in the showroom! I saw an iBook in CPUsed with missing keys, the
salesman told me they had it happen about a week ago and they still don't have
a replacement. I've seen the same with flaky iMac and G3/G4 keyboards.

Standard for any new PC.

> MC68060 with at least 66Mhz, 80Mhz is under construction

Why not G4?. 68060 is slow by todays standards.

> 64MB-SDRAM (with full Bus-speed access at 66/80Mhz!!!!)

One should hope so, once again 64Mb is a standard minimum these days. How much RAM does the board support?.

> HDD: at least 10 GB (maybe 15 GB)

Again, standard size harddrives. They don't make much smaller drives anymore.

> SoundBlaster SB64 PCI

That's cool, and also a standard item for a lot of PC users.

> ATI Mach 64 with 4MB Videoram, expandable up to 16MB

Run of the mill stuff...

> 2x IDE, 3x serial, 1x parallel, 2x USB (hot plugging!), Keyboard,

Hmmm, PC's offer plenty of choices in other operating systems. Linux, BeOS,
QNX...
Of all the software available, most of it is for Windows. With a dual boot
configuration you can enjoy the best of both worlds.

Great news for current Atari users, but I seriously doubt the new Milan is
going to wow many away from their current platform.

Regards,

Clockmeister.

100,000 isn't alot. Atari didn't have anymore to sell either.
Constantly Atari failed to meet needed production requirements. Atari made
a decision to send the few Ataris they manufactured off to Europe where
there wasn't a case of IBM itis.

If you think any of the above programs were any good in 1985, you
suffer from the same traits as all ignorant North American users.

Anything requiring DOS and lacking a mouse was CRAP. WordPerfect was CRAP.
LOTUS was also crap. Claris was CRAP and anything else they did was on a
computer that was too expensive and couldn't run DOS. The great American
Standard at the time.

Europeans understood, price and quality. Atari fit the bill. Smart
North American Buyers also purchased Ataris. Those that did some sort of
research. I have in my hands a book made in 1986 that is 350 pages in size
listing software released for the Atari ST.

You may consider Imac purchasers to be smart consumers. The real world
of Microsoft users know that they are fools. Much as Atari NA users were
considered to be.

However my Ancient 520ST with simple ram upgrade runs software far
better than LOTUS, WORDPERFECT and Claris stuff. I certainly should hope
so. However I have WordPerfect for the ST, and LDW power (Lotus Clone) but
that doesn't mean that these programs were the be all and end all.

If Word Perfect was any good, it wouldn't have been dumped as soon as DOS
users had the chance to upgrade to Windows based products like WORD, EXCEL
and others. Product that had their beginnings on the Mac.

What Atari didn't do was inform the public that their software was
better or superior in many aspects to those offered on other platforms.
Ataris worst problem in NA was its NAME! Bugger all to do with your
statement.

DOS users had no idea with regard to.

1) Desktop Publishing
2) Computer Animation
3) MIDI

4) GUI

All aspects with could be done on a Mac at the time but

1) More Expensive
2) SLOWER
3) Inferior software and hardware to the Atari.

By 1987

Staple products such as

CALAMUS
CYBER SERIES (SCULPT, PAINT, 3D,)
NOTATOR
DYNACADD

created a computer that certainly had the software.

Inferior products with brandname association were release to appease the simple minded.

WRITE, WORDPERFECT
LOTUS CLONES, VIP and LDW.

The software definitely was there.
The user base was not.

The software for the clones of ibm wannabes was about as useful as the trash computers they ran on. Oh wait , I hit the turbo button.

Meanwhile, look at my expensive mono mac.

Distribution, not software quality was a problem.
Acceptance buy the computer buying public was also a problem.

I thought you had an Atari once, so you claimed some months past. If you did and you actually used it, you would know this.

North Americans are a stupid lot who worship Brand Names over Specifications and Quality.

Thats why they buy
1)NIKE
2)TOMMY HILFIGUr
3)and Calvin Klien Underwear.

Products that offer no better value/quality than non brand names equivalents, but cost 4 to 5 times as much.

If you think WP is a good program maybe its time to invest in Coral:-).

All agreed then :-)

>
>BTW what are the specs of the new Amiga and the release Date:-).

The Amiga Inc. Amiga?. Some OS layer on top of current OS's... a load of
shit no-one would be interested in.

The Phase V Amiga?. G4 (with 68k emulation at '060 speeds apparantly), PCI,
USB, whatever soundcard is popular at the time, 3d accellerated graphics
card of some sort, whatever harddrive is current at the time, QNX realtime
OS, AmigaOS or Linux bla bla bla...

AmiRage I think it's called, due sometime next year I think.

I think the '060 Boxer is now available for ordering also.

To be honest, I've lost interest. If a new machine should appear, I'll judge
it on its merits then.

I wish Gateway would sell the rights to the Amiga to someone who cares :-(

Regards,

Clockmeister.

So your saying that Amiga users are dumb? Can't fault the public
attitude towards Atari..What's an ST? Advertising is part of the cost of
doing business. Atari forgot to include in total price.

> You may consider Imac purchasers to be smart consumers. The real world
> of Microsoft users know that they are fools. Much as Atari NA users were

My Apple IIC with AppleWorks kicked anything on ST land and that had a
slower processor... I see. the slower the better.

I have..its paid off. Bought in at under $4...Last trade at over $14.

When it hits $20-$30 will be enough to get a G4 if desired. But will
ride it out. Corel has a Linux focus that may pay off.

Peter

and over here, Edith Professional and AtariWorks - incredibly powerful.
I did some major document work with Atariworks last year utilizing
TrueType fonts and NVDI, I got many compliments on how the project looked.
And you should've seen the look on their faces when I told them it was
done on an Atari :)

Also recently helped another Atari user who was looking for a new copy
of First Word Plus, he told me that of all the word processors out there
for any platform, it was his opinion that humble ol' First Word stands
head and shoulders over what's out there for the Mac and PC today.

>
> And I'd still buy another Atari - if they were available ,with 96 or

>
> Nor will R Dan or any other TAF member !

oh really?

judging by the fact that Milan GmBH has so far succeeded at their goals
(even surpassed them), I'd say we will see the Milan II in North America
by the middle of 2000. At the Hannover show they re-iterated that a North
American launch is still in their plans.

And with both Motorola AND Hewlett-Packard (I must admit, the HP
involvement was a VERY pleasant surprise) involved in the building,
marketing and support of the Milan II, AND the fact that there will be no
Tramiels around to screw this one up this time, I'd certainly think that
it has a fighting chance here.

In any case, Ken has expressed an interest in getting one (he's looking
at printers right now, and he just might get an HP in anticipation of
using it with a Milan II), and I'm planning another UK vacation for April,
so who knows, even if it's not officially here by then it may wind up
having resident status under my desk next to the Quadra :)

I bet you didn't know both also exist on the ST, with superior
features than the Mac/PC versions of the same era?

> Apple invented desktop publishing with Aldus and the LaserWriter.

Apple hadn't released the Laserwriter when Atari introduced
their own SLM804. Calamus also existed before Aldus.

> Which still sold more machines the ST

Not in Europe.

Except, for the most part, ISA is unecessary. Nearly anything
that used to come as ISA cards now comes in PCI ones.

As far as GEMulator goes: it should be unecessary. As long as
you have a copy of the physical ROMs, posession of the image
files is fair use.

>GEMulator is restricted to ISA]. Though I would like to see
>more than four PCI on anyone's MB(like six would be nice).

Look at the Tyan motherboards. They have some interesting
dual socket 1 boards with lots of slots and lots of built
in peripherals.

You can also get ~ 1Ghz worth of PIII for ~ 500bux.

[deletia]

Although, I'd rather wait for a similar board to be released
for the Athlon due to the CPU ID BS.

The above programs that YOU listed were WordPerfect, Lotus and Claris.
Hardly a way to start a debate.

>MacWrite and MS Mac Word totaly destroyed all wordprocessors on the ST
>period!

And all you had to do was mortgage the house to purchase a Mac. Mac Write
was forgetable, and MS Word, certainly was a force. But you didn't mention
this as the failure of Atari. You blame Atari marketing and software that
was inferior to the PREVIOUSLY listed, not the latter. Your argument starts
based on PC DOS based machines, lame, but tries to salvage itself with a
move to Mac.

>> Anything requiring DOS and lacking a mouse was CRAP. WordPerfect was CRAP.
>> LOTUS was also crap. Claris was CRAP and anything else they did was on a
>> computer that was too expensive and couldn't run DOS. The great American
>> Standard at the time.
>
>WordPerfect kicked all in the ST World period!

Only in SALES and in lack of intuitiveness. This has little to do with the
quality of Atari Software.

>> Europeans understood, price and quality. Atari fit the bill. Smart
>> North American Buyers also purchased Ataris. Those that did some sort of
>> research. I have in my hands a book made in 1986 that is 350 pages in size
>> listing software released for the Atari ST.

>So your saying that Amiga users are dumb? Can't fault the public
>attitude towards Atari..What's an ST? Advertising is part of the cost of
>doing business. Atari forgot to include in total price.

I never mentioned Amiga users in this thread. Looking for allies? Amiga
had a stronger distribution base in NA. But many people purchased the
Amiga. It had some very strong technical points and some huge massive flaws

that many users choose to overlook. Amiga certainly took the wind out of NA Atari Sales, with some excellent advertising that eventually broke the company. But yes, anyone looking at a spec sheet would have been impressed with the Amiga.

Advertising a cost of business? Generally agree, ever heard of Blair Witch Project? Word of Mouth/internet adversting. Mac Launched during the Superbowl. Definitely caught everyones attention, and consuming public paid a higher price for the product accordingly.

Again, the NA moron Hilfigur, Nike attitude. IF I pay more it must be better.

>> You may consider Imac purchasers to be smart consumers. The real world
>> of Microsoft users know that they are fools. Much as Atari NA users were
>> considered to be.

>Eh Beavis...Many MS users use Macs...duh! I am a MS user.

Save the name Beavis for someone else. You are an Apple computer user and claim to use BEos. We saw in the previous post that Apple computer would be dead in the water without M$. And all it took was for STeve Jobs to totally sell out and open up his anus for the M$ penetration.

Like the PC name came to be known for the IBM computers and then the clones and compatibles, I don't believe that the term Personal computer needs to be associated as much today with IBM as it does toward M$.

But it is a flaw and is incorrect. So let me say it more directly. The masses of users using PENTIUM based computers running Windows 95 and up clearly see no advantage to owning an inferior product such as the iMAC.

>> However my Ancient 520ST with simple ram upgrade runs software far
>> better than LOTUS, WORDPERFECT and Claris stuff. I certainly should hope
>> so. However I have WordPerfect for the ST, and LDW power (Lotus Clone) but
>> that doesn't mean that these programs were the be all and end all.

>My Apple IIC with AppleWorks kicked anything on ST land and that had a
>slower processor... I see. the slower the better.

Oh, and your apple IIC ran WORDPERFECT, and LOTUS? But lets not drag the Apple II forever into this. It is irrellevant to your argument.

>> If Word Perfect was any good, it wouldn't have been dumped as soon as DOS
>> users had the chance to upgrade to Windows based products like WORD, EXCEL
>> and others. Product that had their beginnings on the Mac.

>Blame Novel at the time.

Ok!

>> What Atari didn't do was inform the public that their software was
>> better or superior in many aspects to those offered on other platforms.
>> Ataris worst problem in NA was its NAME! Bugger all to do with your
>> statement.

>Double Edge Sword!

Ouch!

>> DOS users had no idea with regard to.

>> 1) Desktop Publishing

>Apple invented desktop publishing with Aldus and the LaserWriter.

Not saying they didn't. Never did. I am saying that when Atari came on
board the products available where neither inferior nor substandard.
I am not going to debate you on Calamus, I am only going to state that it
is not a piece of inferior software, quite the opposite.

>> 2) Computer Animation

>Yep done on the Amiga to

Me too, your point here is? Mine is dealing with your argument stating the
strength of DOS based programs WORDPERFECT and Lotus vs a powerful computer
at the time known as an ST. If you bring the Amiga into this I will have to
have an argument with myself.

>> 3) MIDI

>I'l give you that one..

But we are talking inferior software applications? I am seeing that you
have now agreed.

>> 4) GUI

>The Mac has the best gui period.

It did have. It is pretty old now. Well see what happens in the next OS in
the best of Tramiel fashioned RSN. And even if you consider it better than
Windows, you aren't going to convince the real computer buying consumer.

>> All aspects with could be done on a Mac at the time but

>> 1) More Expensive

>Which still sold more machines the ST

I don't think that was in debate? It is indirectly what the thread was
about. Everything sold more than the ST. DOS based machines sold more than
the Mac?

>> 2) SLOWER

>Depends..I was an Amiga user in 1987.

Well, it doesn't depend. It was slower. I too had an A500 and 87. And I got
rid of it in 88. Got the A3000 in 90 bunch of 2000 with toasters and A4000
in 1992. Don't run to Amiga for security now. If you are uncertain of what
early Macs could do, then leave well enough alone.

>> 3) Inferior software and hardware to the Atari.

>Are you on drugs?

No the following products in 1987 were superior to anything on the Mac in 1987. Now if you want a real fire. Even though the ST lacked the Colour of the Amiga, and had an inferior composite output (actually a joke compared to the Amiga) The cyber series software kicked ass of anything available for the Amiga at that time. Plus the fact that the Amiga couldn't do complicated real time animations without choking as the screen slowed down its video output, whereas the ST continued along at 32fps. This even continued with the A3000 in the same screen res as the ST.

You have no answer to this. The Mac didn't even have a real Cad program at the time, not even anything comparable to Drafix, let alone something as Powerful as Dynacadd.

And as for Notator. Well Mac was Midi until the ST came along. Clearly showing the superiority of ST software during this early period in Atari history.

>> By 1987

>> Staple products such as

>> CALAMUS
>> CYBER SERIES (SCULPT, PAINT, 3D,)
>> NOTATOR
>> DYNACADD
>>
>> created a computer that certainly had the software.
>>
>> Inferior products with brandname association were release to appease the
>> simple minded.
>>
>> WRITE, WORDPERFECT
>> LOTUS CLONES, VIP and LDW.
>>
>> The software definitely was there.
>> The user base was not.

>Blame Atari

>> The software for the clones of ibm wannabes was about as useful as the
>> trash computers they ran on. Oh wait , I hit the turbo button.

>I agree to a certain extent..

Well, if you agree to a certain extent that the software for the clones was just as bad as the computers they ran on, I wonder why you started with WP and Lotus for DOS?

>> Meanwhile, look at my expensive mono mac.
>
>The market did not think so...So why did you buy that expensive mac?

I didn't, I bought an Atari, which I am still using, at this very minute to respond to your insight. If I did buy the expensive Mac like my friend did, it would be in the trash with his by about 1989. This is not a bad statement, that would be roughly 4 years of computer life.

>> Distribution, not software quality was a problem.
>> Acceptance buy the computer buying public was also a problem.
>>
>> I thought you had an Atari once, so you claimed some months past. If you
>> did and you actually used it, you would know this.
>
>I decided the Amiga was better at the time.

Great for games. Came of age with the 3000. Certainly not as user friendly as an ST. Also required alot of hardware to be effective.

Now think of connecting a laser printer to a mac in 1987. Both slow and expensive with good quality. Atari with laser was price of Mac and was lightening fast. THings that took 11minutes to 30minutes on the Mac to print would be out in between 11 seconds and 40 seconds on the ST. Very similar to the output of todays lasers, although todays quality is superior with higher resolution.

>> North Americans are a stupid lot who worship Brand Names over
>> Specifications and Quality.

>Like the flimsy ST? The name brands were all about quality. Sounds like
>sour grapes..

My 520 is 14 years old? It has a ram upgrade from 1987 and has run flawlessly.

Packard Bell is a name brand, Means nothing to me. At no time do name brands mean anything. This is the computer industry it is dog eat dog, and the name means nothing unless the components are of high quality. An Atari is a computer assembled from components made by other namebrand manufacturers. Any computers you have will have diodes and resistors and heat shields with Mexico or Korea written on them somewhere.

If you think that someone buying a Name Brand IBM PC computer has a better product than someone buying a computer that isn't, then that is your opinion, but it is not mine.

>> If you think WP is a good program maybe its time to invest in Coral:-).
>
>I have..its paid off. Bought in at under $4...Last trade at over $14.

Keep a close eye, he is being investigated again. And this time it don't look pretty. Insider trading may be the end of Coral. But he did do really well himself when the bottom fell out of the market for Corel Products.

>When it hits $20-$30 will be enough to get a G4 if desired. But will
>ride it out. Corel has a Linux focus that may pay off.

Well, he was also on the Java bandwagon. Linux focus is great for linux users. Whether it ends up paying off or depends on alot of factors in the computer industry that are well beyond the control of shareholders or the focus of a company.

I personally, hope it does pay off for Linux sake, but that doesn't make the current WordPerfect is a good product either.

I'll not live another 50 years - maybe 30, if my father is any
indication !

> BTW, do you use MagicMac by any chance? And if so how do you like it?

Nope - I still use the Atari for DTP as I haven't found a reasonably
priced Mac alternative to Pagestream - although the Pagestream boys
have a Mac version available - from what I read it is dicey with OS 8
and maybe even more so with OS 9 !

And I haven't gone hunting for MagicMac !

But for the 'productivity bit' I find Appleworks quite adequate and
capable of much bigger files than LDW or Informer 2 - both great
products for theor day - and still fine today but for some stability
problems with Informer that didn't get fixed before the developers
stopped Informer support !

How can they call themsleves "Atari folks" if they migrated?

Ah yes, right... like those Atari Historical Society folks at
icwhen.com: we'd rather muse about good memories of our first
real job (which happened to be at Atari) than provide support
to those who strive to keep the flame burning. Who cares if the
sources to MultiTOS are forever lost....

shove the desktop over to an older monitor while concentrating on CAD or Graphics or
video editing on the newer, larger one.

Conversely for game players, create yourself a panoramic view.
it is only limited by ones imagination.

currently I don't have the real estate for the Falcon, PC [shared monitor via sw]
mini-tower and shared SCSI box right now but it would be nice as Gemulator takes over more of the Falcon's duties, then run Gem on one, Windoze on another.
[many Gem utilities like Pamflite, Datalope [if you own HP printers] and Shredder
Plus can't be beat] though I would like a file selector that while running under single
TOS can handle long filenames, UIS always defaults to the DOS names during copy and move [hate windows explorer]

one thing, using ST- Zip and other extractors results in file dates of 20xx until those
files are modified by use then they return to */*/99 dates. [weird ...or cool depending
how you feel] though I do have the free Aladdin extractor but Aladdin does not like
encrypted files, in that case ST Zip 2.6 works fine.

4602. Atari Web Site: Updated!

Newsgroup: comp.sys.atari.advocacy
Date: 1999-12-03 00:00:00 UTC
From: Nurmix@socal.SPAM
Message-ID: <8281ri25fp@enews3.newsguy.com>
Source record: 2367

Just a little note to let you all know that NURMIX WEB CENTRAL has received a major update to the Atari pages.

http://www.tsotech.com/nurmix/home.htm

I've been working on it for the last few weeks, and it's pretty much done at this point (at least the basic structure is done - I plan to add a lot to the DOWNLOAD and LINKS pages in the very near future).

Anyway, it was completely done on my Falcon using QED/CAB and various graphics programs for the images. Please, take a look and let me know what you think.

There is a sort of "Atari History" section, detailing both the 8-bit and ST line. And a section about my personal story/history with Atari computers, in addition to the links and download pages.

And also, if you'd like your web site to be added to Nurmix Web Central's Atari LINKS page, please send me an e-mail and I'll check out your page, and add it to my LINKS page.

As a final note, the Atari pages of Nurmix Web Central utilize FRAMES. If your browser doesn't support them, or if you just plain _hate_ FRAMES, then turn them off, and non-FRAMES pages will automatically load.

Thanks for your time, and enjoy!

4603. Terry Mays New computer :^).

Newsgroup: comp.sys.atari.advocacy
Date: 1999-12-04 00:00:00 UTC
From: madmax@bfree.on.ca
Message-ID: <iQZ14.1367$Vf2.821@198.235.216.4>
Source record: 2368

Hi Terry.

You wish to compare computers 7 years old to 15 years old against your new purchase. I hope you will be in a position to compare your current purchase in 7 years or even 15 years but somehow I am 80% certain that you will have a new computer in under 3 years.

You list hardware items for you PC. Your computer is NEW! HELLO!!! Your arguments on comp.sys.atari.st have NOTHING to do with Pentium/WIndows vs Atari but more truthfully a NEW computer is BETTER than an OLD computer. This is a FANTASTIC argument for the computer industry, but still bad for the consumers pocket book, no matter how much technology improves and the cost per feature declines.

How many items have you listed that will work on Pentium 200? You will have mixed answers. How about a 4 year old 150? Or a 5 year old 75? Better yet lets get closer to the Falcon. How about a 486? How about a 386? Lets get closer to the ST how about a 286 or 8088?

Got some news for you. The shine will fade. The keyboard on my brothers machine failed. Since that particular keyboard was discontinued, his warranty would only cover partial costs. His computer was 3 months old.

My friends P 150 came with 16meg of ram 4 years ago. What a surprise to discover that ram was proprietory and he is screwed.

How can you expect devices that didn't exist to be plug and play with an ST? And what a surprise it seems that many of these devices work on STs. The same can't be said for the other computers.

Throughout my 14 year association with Atari only one thing is certain. People have left it for a PC based computer. The only other certainty is that they will be constantly replacing their old computer with the NEW computer in order to run the latest OS version of Windows.

You will be purchasing a newer computer sooner than you think.

Is your computer better? I should hope so! Is it a better purchase than my ST? I don't think anything has matched my original ST purchase. I still like it better than my Falcon and TT which I recently aquired.

The fact that quite often you are found comparing your NEW computer to what we are using in comp.sys.atari.st is more a reflection of the power of the Atari computers than it is a reflection of the power of your latest purchase.

You say you still have Atari in your blood. This is probably true. It runs through the veins. I missed my ST. I brought it back to life two

years ago and haven't looked back. Sometimes absence makes the heart grow fonder.

For me the second biggest thrill with my ST was finding all the other users in these Atari NGs. As an ST owner in the 1980s was still a lonely experience. Now I enjoy being part of the Atari community and this is something you can't buy.

Later Brian.

The Millennium...

Twas the night before Y2K, and all through the nation, we awaited for the Bug, The Millennium sensation. The chips were replaced in computers with care, in hopes that ol' Bugsy wouldn't stop there. While some folks could think they were snug in their beds, others had visions, of dread in their heads. And Ma with her PC, and I with my Mac had just logged on the Net, and kicked back with a snack. When over the server, there arose such a clatter, I called Mister Gates to see what was the matter. But he was away, so I flew like a flash, off to my bank, to withdraw all my cash. When what with my wandering eyes should I see? My good old Mac looked sick to me. The hack of all hackers was looking so smug, I knew that it must be The Y2K Bug!

His image downloaded in no time at all, he whistled and shouted, let all systems fall! Go Intel! Go Gateway! Now HP! Big Blue! Everything Compaq, and Pentium too! All processors big, all processors small, crash away! Crash away! Crash away all! As I drew in my breath and was turning around, out through the modem, he came with a bound. He was covered with fur, and slung on his back, was a sack full of viruses, set for attack. His eyes - how the twinkled! His dimples-how merry! As midnight approached, though things soon became scary. He was chubby and plump, perpetually grinning, and I laughed when I saw him though my hard drive stopped spinning. A wink of his eye, and a twist of his head, soon gave me to know a new feeling of dread. He spoke not a word. but went straight to his work, he changed all the clocks, then turned with a jerk. With a twitch of his nose, and a quick little wink, all things electronic soon went on the blink. He zoomed from my system, to the next folks on line, he caused such a disruption, could this be a sign? Then I heard him exclaim, with a loud, hearty cry, happy Y2K all, kiss your PCs good-bye!

A reasonably recent version of ghostscript should have
a pdf to ps converter (pdf2ps).

[deleted guru humour]

> How does one respond to this, its hilarious.

Despite the tongue-in-cheek flavour of the guru humour bits, the question above _is_ a honest, serious question.

With all the people saying that the whole Atari platform is dead, based solely on their past experience of a floppy-only 1040ST [1] and without any experience of a TT or Falcon's added benefits [2] one might wonder what usefullness an ST might have nowadays.

Btw, there's no point in telling people like Sinclap that some folks still use their ST, in a heavily souped-up form, to surf the net, on a daily basis. Read note [2] again for the reason.

So, assuming one has an upgraded STE (with TOS 2.06, 4 MB of ram, Mario Becroft's IDE interface and an internal IDE drive, an Ajax chip and HD floppy drive), what could anyone possibly expect to accomplish, given CompUSA's "record-breaking sales of the iMac" and "Windows' de-facto standard OS status" nowadays?

****

[1] as in "Last time we tried Atari, we had Cubase going on an ST using floppies and it was cool but, when the Internet arrived, we knew we had to upgrade to a real machine."

[2] not that they would have ever bothered to actually _pay_ to upgrade their ST's TOS or to get a hard-disk, in the first place. "We don't waste money on a toy; only to upgrade to a real puter."

Things to be considered. A dead platform and an obsolete platform are not necesarily the same thing.

1) Communication of information is the only way to ensure life to the Atari Platform. Most Atari Users discover that the ST and Atari computers are not dead after they have purchased a PC and got onto the internet. Many American ST users will have believed that the Atari ST died the day the dealer stopped supporting them. Therefore the Dead computer thinking could occur as early as 1988 when many Atari Dealers where leaving.
Without a source of information there is no way to know that there is continued development of the Atari Platform. There are no articles in computer magazines and there are no Atari Computer Magazines. Even when there are Atari Mags, the distribution is so erractic and localized that many ST users never see or here of these Magazines.

Therefore based on the scattered user base of STs stuck in a closet with no mags or distribution system for information and software, one can argue that the Atari Platform is dead. That is until one is on the internet. Then if one chooses to look they will find software and hardware developments not only for the ST but for the rest of the Atari computers and clones. These people are people such as myself.

Short Story.
2 Weeks after buying my ST I was told that the computer was a poor seller with a weak software line, and will be eliminated with the arrival of the new A500 Amiga. People who want real computers will buy PCs and those with money will buy Macs. But at this moment the C64 is still outselling the ST in our store. This statement was made to me buy the store who sold me the ST as my first computer, based on the information that I wanted an affordable business computer, not to play games on, and that I wanted a graphic user interface, (this decision was based on my girlfriends input as she was into computers and used Macs, while I knew absolutely nothing and wanted to get a DOS BOX.) Of course PANIC set in as my two week old computer was already being designated an Orphan buy the dealer who sold it to me. Therefore in their mind the ST was dead. They never pushed the Atari line the entire time they distributed them. I at first regretted my purchase, I have an ORPHAN. I bought programming books because, obviously I was going to have to program my own software as none was to be forth coming. Of course the ST wasn't orphaned just yet.

However by 1992-4 I had left the Atari as a computer in which I purchased anything for. The DTP/Calamus 1.09n and Laser where to be used for a few more years before being given away. I moved to Amigas for more Animation functions, and CyberSculpt eventually was being replaced by Imagine.
The ST still had a function but not a progressive function. It was left to do exactly what I had purchased it for. I returned to University where 386/486 where the order of the day. I used my ST, which was now my Nephews. THe computer was still useful, and certainly not obsolete, considering even that older version of Calamus had the upper hand over its PC rivals of the day.

By this time the Atari Dealers had all but disapeared. Much of the software everyone takes for granted today, software released from 1994 and later, has never been heard of by an ATARI ST User. Myself included.
You can't sell without distribution. The internet was still not user friendly or as accessable. My Nephew continued to use the ST for BBSs up until 1997. Actually both my Nephews had Ataris. But even the BBs in the Area were not Atari BBSs with Atari information. For all intensive purposes, there was and is no support for Atari Computers. THere is no one to ask, and no one to give answers. The Atari Platform is effectively dead for many ST Users because they don't even have an Alternative to consider.

Then came the Internet. Access arrived in my city on mass. BBss fell like rain. While my Provider happens to be very competent and can support all makes of computers and recommends 386 and up. Other providers will constantly increase the entry ante, leaving users with no other impression that they need a new computer and that the computer must meet a certain spec. THis is of course a PC spec. Going into a dealer, I actually had a women tell me the Celeron 300mhz system they were selling dirt cheap couldn't get on the internet because it wasn't powerful enough. Not that it was inferior to the other PII product they were selling, no, it simply couldn't be done because it was too slow and didn't have a cache. I told her I would keep my ST vs buy a new computer since I was already on the internet:-). Regardless this is the impression users have. They also are bombarded with MAGS and ADDS and other users who can suggest a myriad of ways to spend their money. No one can mention ways to save their money and use what they have until their is a NEED to get a new computer. This is no different for A500 Floppy Amiga owners, or Older PC owners. Obviously most of this discussion will revolve around the internet.

Therefore their is no consideration to use an ST on the internet, as clearly it can't be done from the information they have at hand. Also to do it properly requires spending money if they have only a 1040ST with Floppy. There is no information at hand on where to buy these goods that are required. There is no information available as to where on can buy these ST devices, whether it be ICD or Marios Products. When one compares the money spent over a period of 10years on an ST, this isn't as expensive as it may appear. You spend a couple hundred bucks for a gig hd and adapter, and have a tonne of room. THe other option is to spend a minimun of $1000, and be obsolete in 2 years and do it again if you wnat to run the latest game and internet software. People really don't like this but they accept this. Others say it is progress. Both are correct. But having a computer that is

effectively obsolete in 3 years, can't run the latest OS upgrade or Game, vs having a 15 year old computer that can is a question that many ST users with their STs in the closet, never have the chance to ask themselves.

If you do have the information and the available resources to use your ST on the internet, then only at this time can one make the choice of investing (sinking more money) into their computer is worth it.

After this information is digested, one would also be aware of the other ATARI alternatives vs the other platform choices available. They would also be in the position to not be a complete plug and play internet moron.

Now I will leave that the ST is an inferior internet computer to the >68000 computers available. That updating an ST can bring you close to the price of a USED FALCON or TT. At this time, and only at this time can consideration to the 68030+ machines occur. And look at all the obstacles. At this point, the users must recognize the fact that the TT/FALCON + computers are also an inferior internet computer. If you need video STreaming, Java, etc, these things are just not yet available. Now the use can decide with all the information available, if this is the direction he wants to continue in. For Me, my TT and Falcon, I purchased for less money than I could have gotten a Pentium based machine, years ago. And today those machines ARE OBSOLETE. I am looking at all these minimum specs in the adds and I would think their are many users who must consider they NEED to upgrade.

If one has to have all the latest and greatest and suffers from Computer envy, they will be playing keeping up with the JONES on their PCs.

If one wants to marvel at their sole computer purchase 10 to 14 years ago, and say, Hey, son of a bitch, my computer is on the internet and bugger all else from that time period is. Certainly shows the ST was a technically advanced computer.

Now I have address the Falcon TT issue and the obsolence, dead platform issue as best as I can for today. I will now focus on the 2nd point of discussion.

> [2]
>one might wonder what usefullness an ST might have nowadays.

1) The ST can do and will always do what the software and hardware you purchased for it when you bought it. Therefore, if you were doing MIDI, DTP, Spreads, WP, nothing has changed. There really isn't any advantage to using another platform. This is true even if you don't have a HD with your ST. Although clearly this is a great benefit.

2) Finding the resources you can upgrade your ST, (see below) to do the above better faster, and even in colour.

3) The ST is not an isolated, dead turtle. You CAN hook it up to the internet. You DON'T have to buy a NEW computer. You will LOCATE more,

better and more current software for your computer than in the first 12 years you owned your ST. Going to UMICH can be an ST users dream.

4) CD ROMS, Cd Burners are not something that ST users can't hook up to.

5) The knowledge and support on the NG with the ability to access it with your ST, gives your more support than when you had to deal directly with the Dealer. Tech SPecs, Schematics etc are all easily available.

6) The ST can be HACKED, and they are cheap if you screw up, get another one and do it again. You can learn something and have fun.

7) Because the ST is limited in MHZ, and RAM you will have to be creative to get the most out of it. But it does allow you to participate. This alone is reason enough to use.

AVI, MPG, FLM, etc are all viewable with the ST. JPGs and resolution with CAB require many tricks to be appreciated on an ST but the end results can be STunning.

Take a JPG, Load into GEMVIEW, convert to Photochrome Targa Format. Load into Photochrome, and save. You have a HUGE file, but the COLOUR will make STock Falcon users take notice, and PC users will not have words to describe that they are looking at pictures on an Atari. I have done this as I have a very hard core tough crew to impress. They won't ever be Atari users, but I know when they have left they go home trying to do what I have done. Especially impressive are simple ST demos running off an floppy disk. I alway am asked where is the HD, and how big is the file for when music is being played.

I just wished I had never left Atari so that I would know more than I do currently.

If someone really wants an Animation on the ST and it is in MPG format, you will need to decode it to run in real time. THen there are a couple of alternatives. Run the created gif files into MPSTe.prg as script. You will need ALOT of HD room, but you can break the animations into shorter flics that run in realtime on the ST. You can also convert these picts to either Spectrum format and run with Anispec or PC1 files and load into cyberpaint.

Think of me an Pamela Anderson MPGs and only an ST to view at the time:-).

8) and don't forget the games. THere are many ST games found on the internet, that are in FTP sites and webpages that many users never saw.

9) I still believe people like to program on the ST/TT/Falcon.

10) I think people get a feeling of accomplishment when their ST is on the internet, regardless if they have a Falcon/TT/Milan/Hades or a PC or Mac already connected. This gives them reason to use their more powerful computers, and then see if some of the features can be implemented for the ST. It also gives more freedom to think about hacking an ST to get more performance out of it. Upgrading serial etc.

11) I love pointing to my 1st computer purchase and saying I can do that, while my PC using friends with older computers say that they can't and their computer is only a few years old. I have many friends not on the internet with their PCs because... See saleswoman above... and they don't want to invest more money in Ram etc into their obsolete computer, just to get on the internet and not be able to do everything, when a new computer that they are saving for can to it all. I am not talking 486s, but i could I am talking P166 and below users. I don't care what they can and can't do in terms of actual potential, see above, and you will realize that the story is the same no matter teh platform. THerefore if you don't have the latest PC, your PLATFORM is essentially DEAD, because you CANNOT run the latest software and hardware updates are even MHZ specific. Sounds like a ratrace to me. On the Atari, even internet software will run on an ST. Many new developments work on the ST. Certain things are just not possible without serious mods to the ST, if at all. But Listening to MP3s isn't the end of the world to me. I know little about them, but wonder if I couldn't just download them, write them to CD and play them as a standard audio CD. Like I said I don't know. Or if they could be decoded and written to the CD without compression and get better quality sound and played. Like I said, I don't have a clue, so ignore this part of my argument as I am just speculating. However if this was the case, I guess to me there is little difference whether I am playing music off the hd or off a CD.

Of course I do have a Falcon, so perhaps I should try these files out, as I have never bothered. Unfortuneately I am not the know it all I appear. I am learning and always learning, and perhaps owning an ST/Atari Computer allows me to learn more and ask stupid questions, without just being able to DO something on a PC without a clue of what is going on.
So, I don't know what audio MP1, 2 or 3 is. Other than a compression for music files.

So ST users, have alot of Internet tools available to them, but many STs are in the closet and the user now resides in PC land without ever knowing.

But when I show my 15year old computer on the internet, multi tasking, running a webbrowser, mICQ, IRC, NEWsie, (Email, FTP, NTTP) I get RESPECT, because they think I know something more than they do:-). But we know that isn't true. When I am in 16 colour and they complain about the graphics, I pull up some converted bike pictures and there is silence. It is more work of course, but then that is a pleasure sometimes as you feel like you have accomplished something.

THerefore while the ST is restricted in its ability, there are possibilities for anyone willing to accept a compromise. And that is all I can really say. Of course I could have said that in one line:-).

>Btw, there's no point in telling people like Sinclap that some
>folks still use their ST, in a heavily souped-up form, to surf
>the net, on a daily basis. Read note [2] again for the reason.

No there is no point at all. I decided to avoid ST hotrods. There are 12meg MegaSTs out there with MegaBus Graphic cards and various accelarators. Then the PAK 030 MegaSTes. And then the 020 Velos etc.

This is simply the fun part of owning an ST. THe hotrodding. And no they aren't as fast as a PC. But they aren't burdened by Windows either.

>So, assuming one has an upgraded STE (with TOS 2.06, 4 MB of ram,
>Mario Becroft's IDE interface and an internal IDE drive, an Ajax
>chip and HD floppy drive), what could anyone possibly expect to
>accomplish, given CompUSA's "record-breaking sales of the iMac"
>and "Windows' de-facto standard OS status" nowadays?

Same as always, but get on the internet with fewer restrictions than with a 1040ST or a terminal connection.

Maintain contact with Atari users and developments.

Be part of the Atari Community.

Make a more broad decision as to the next computer purchase.

No one expects the Milan II to be the Last Clone. They can get faster, and become more feature oriented similar to the NEW alternatives mentioned above.

Surf the Web. Not all pages, but shit their are millions of pages out there. And I was on a motorcycle NG with this old beast. The users couldn't access a Motorcycle webpage with his PC. Sure enough the ST could and nothing made me more proud to say, I have downloaded the webpage, and If I can get you should be able to. Problems occur for everyone and it is not platform specific.

>[1] as in "Last time we tried Atari, we had Cubase going on an
>ST using floppies and it was cool but, when the Internet arrived,
>we knew we had to upgrade to a real machine."

Heard it all the time. From my youngest nephew, who has been through 2 PCs and a couple graphics cards, 2 defective monitors, one spent HD, numerous times to the Dealer with problems that only they can solve. Files on the HD which can't be deleted and lots of other stuff. But he is happy. And can do online banking which at this time my ST can't. My other nephew ask me if I could get the ST on the internet, and here I am. He got a PC 3 months ago, but didn't want to leave the ST. However he is happy with the internet abilities of the PC although this computer has already been orphans by Packard Hell. Such is life. Welcome to the REAL COMPUTER WORLD.

Now the above statement is great, because I find if they are serious about there work, they will either spend a MIGHTY FORTUNE on the PC for midi work, or be POVERTY STRICKEN MUSICIANS who have vast amounts of money invested in their musical instruments, and bought a CHEAP REAL COMPUTER only to find that not only was CUBASE running on an ST COOL, it was also BETTER. Then they either return to their Real music computer or now take the initiative to invest even more money into the cheap PC. Regardless, they will have a better internet computer for a time, until, it can't run the new software, or upgrade the mother board. Then their PC is a money pit taking away money from their music.

Luckily Midi is still the easiest thing to defend on the Atari. Simple easy and portable. What is more concerning to musicians is if the damn Atari DIES.

Same is True to a lesser extent now with DTP. You can use your ST or upgrade to a TT or FALCON etc, or pretend you can do better on a real computer.

The biggest problem once again is information flow. As hardware upgrades occur in the forms of Printers etc. many users have no idea that these will work on Ataris and no dealer is ever going to say that they will. Many users even after they get PCs don't even know what a NG is, let alone be able to find comp.sys.atari.st to find information if a printer will work with the Atari.

And if you think I am incorrect here, then why are there always posts from INTERNET PC users asking for printer help with the Ataris, and some ancient ST software package. They may not be using their STs on the internet, but they have still been using them for something.

Finally, there is just some ST software which is just too good to leave. I use my ST and Calamus 109n and the SLM laser and it is just a rocket. I use my Falcon and my HP 660 for colour. But why print everything in COLOUR, I am not made of money.

Now the internet is not the only thing that have made NA users leave the Atari platform to a REAL MACHINE. They have done so for over 11 years and continue to upgrade their many computers since to justify the move.
People who left the ST for the 386? Where are they. Certainly not using them.
486?
And many more.

>[2] not that they would have ever bothered to actually _pay_ to
>upgrade their ST's TOS or to get a hard-disk, in the first place.
>"We don't waste money on a toy; only to upgrade to a real puter."

Very True.

Here are some real PUTER tasks that people I know left the ST for or never considered an ST for. The ST is never a real computer.

286. Run WP, DBASE, 123.

>"We don't waste money on a toy; only to upgrade to a real puter."

I ran an Atari Club for 5 years, as I wanted to find out as much about it as possible, from the moment the dealer told me it was an orphan. But here are a list of reasons for leaving the ST.

Pool of Radiance came out on the C64 before the ST and he didn't want to wait so he sold his ST and bought a C64.

I can get pirate stuff for my, choose computer of choice, AT, 386,486, C64 Amiga.

There isn't a audio digitalized intro for TESTDRIVE on the ST. I will get an AMIGA like my friends. (Fill in blank for many other Amiga Enhanced Games, where the ST was capable, but it was never implemented.)

I can't use my ST wordprocess, spreadsheet, and Database with the ones at work, even if shown they could:-).

Wing COmmander, WolfenSTien, QUAKE etc.

Of course there are a list of reasons to leave but whenever the ST was superior people would rather stick with their platform of choice than use an ST.

PC DTP vs CALAMUS, PAGESTREAM.
PC, MAC, AMIGA vs ST MIDI SOFTWARE.

No one ran out to buy an ST to play DUNGEON MASTER, but truth is they SHOULD HAVE. They stuck with their MONOCHROME PCS or CGA PCS, MONOCHROME MACS, and the AMIGA didn't have DUNGEON MASTER which IMHO is a groundbreaking game that came on one Floppy disk. Infact when one strips down DUNGEON MASTER and adds the MIDIMAZE element you have all these 3d Games that have been the rage for the last 5 years. But truth is the ST has been doing it for YEARS!!!

The ST has been WYSIWYG for YEARS!!! but people didn't switch.

People left the ST for to play games on the Amiga, but didn't think about how horrible publishing on an AMiga truly was. It was defended and accepted. You wouldn't buy an Amiga, say he, ProPage Blows, even though it was one of the first programs I am aware of with 4 colour separation, and buy an ST.

People bought AMigas for Animation, but put up with the timing problems on screen when the animations got complicated, while the ST simply plowed right on through. (Don't worry, dealing with the STs video out was problems enough).

But my point is that for many many many years, the ST held the upper hand in power and price and yet people would accept inferior computers and software while waiting to catch up. And considering that WINDOWS could well have been the ATARI GUI, had they had anything other than vapourware to offer Atari, it is very apparent that PC users where willing to wait 7 years for a working version of Windows 3.1

7 Years in the computer industry, just think about it. People don't even own computers that long.

Amiga Users where willing to put up with inferior video until the 3000 appeared, or purchase flickerfixers, and live with the positives and negatives of the machine.

Mac users have always been happy to pay more for their computers. Even if it is an INFERIOR computer today for the internet. And it is.

So to use an ST, is to accept it for what it is. A 15 year old computer with limits. But the fact that you can use an ST is a testement to its original design.

Infact if HTTP had been developed in the 80s for use on the internet, and there where 28800 modems available, perhaps people would have been purchasing Amigas, MACS, and Ataris, while the PCs users stood fast and defended their text based system.

The computer industry would be totally different.

One last thing, CLOCKMIESTER, if you are reading, I am interested in an old device that was made around 1991 to 2 that gave, I believe roughly 262,000 colours composite output for the Amiga. If you happen to know the name of this device, and manufacturer, as I had it then and my memory fails me, please reply here or email me. If not I better drop into the Amiga NG. This device wasn't a card, but an adapter. It had some flaws but was very cool.

Later Brian.

BTW I am using a Real Computer. It is called a 520ST and was made in 1985. Everyone else is using disposable computers.

Sorry, but my post was just a lighthearted (note smileys and disclaimer)
poke at the advocacy crowd. Amiga and Atari users are in the same boat after
all, but the Amiga advocacy newsgroup is a bit more,uh... lively, shall we
say.

Anyhow, happy new year all, and please lighten up Steve ;-)

Regards,

Clockmeister.

Yes, I know of the device. It plugged into the monitor port if I recall
correctly. The name, hmmm, Graffiti wasn't it?.

I think there where two such adapters around at that time, in fact even
earlier then 1991 I think.

I still use my A1000 but judging by the amount of ex Amiga and Atari users
in the world, I'd say Atari's and Amigas are pretty disposable.
Particularly A500 and 520/1040STfm machines.

Nope, only the signs that your ISP has to upgrade their systems
to recognize iso-8859-15 (Latin9). Netscape and Pine can both
use it already.

Actually I would like to bring this discussion over to comp.sys.atari.st

I had received all your posts just fine. I received your initial TAF DANCERS post just fine last week. WE have written back and forth in the thread. Same with the Wanted to buy STe. Then a week later these posts reappear, and they are in HTML. Also all new posts of yours are duplicated.

I could understand this if you just changed your set-up, but why are the older ones reappearing.

If it is the above problem, then is it my ISP or my NEWSERVER which is WORLDLINX?

I would like to get this taken care of. Strangely enough I have had ALOT of Problems in the last week see .ST thread.

So, who is sending it in HTML, I guess is the question. I want to get in touch with my ISP as soon as possible with the proper facts and get this sorted out.

Thanks

Brian.

One was called DCTV, and it output composite video only.

The other was called the HAM-E, And it was an incredible feat of
engineering. I think Commodore bought the company that made it (Black Belt)
and incorporated some of the technology in the AGA chipset.

But we have NEW MILAN ATARIs. You have VAPOURWARE. Actually, I don't know what you have for new computers, I have heard, but not actually heard of production.

Yes we are in the same boat. The Good ship "LOLIPOP". About as useful.

I would hope that Amiga Advocates are still active. Atari users, other than when prompted are pretty humble. Unfortuneately the Nature of Amiga boasters, or Advocates, 10 years ago made me so embarrassed, I never felt like I was an Amiga User. I was an Amiga Owner. And then there is the person that is not a user but simply a games playing big mouth, useless piece of crap that doesn't know JACK. Unfortuneately those that did the least with their powerful computer shot their mouth off the most.

I had the DCTV, and some stupid ass Amiga snot nose puke would tell me how great and super it was and on and on and on. I would say do you have one? No would be the reply followed with BUT and all sorts of stuff. I found the DCTV to be very interesting, but we chose never to finish a piece of animation on it because of the various corruptions that would appear.

But as a homeusers tool this would have been perfect, if you wanted lots more colour for your home videos. Infact the A3000 certainly benefitted from this device and it was relatively affordable.

It was hard enough sorting through the manufacturers lies, the Amiga Computer mags lies, to get down to the truth on a particular piece of hardware and software. Let alone have to deal with know it all advocates.

I haven't even visited the Amiga NG or ADV but I hope a level of maturity would have arisen over the years. As it is the Amiga Users who pop in here for Advocacy aren't advocates as much as they are interested spectators, with something positive to offer. Hardly anything I would have remembered.

I am afraid to say that I never felt part of the Amiga community.

I owned an A500, A3000 and couple A4000, and a handful of Toasters. +Laser disc recorder etc. and almost a different video card a month as I discovered some weren't as advertised.

And what is worse is how much I have completely forgotten.

Much is the same for when I returned to computing. Only I chose to return to the weaker Atari community, and I had forgotten alot about the Atari. However, I never, had nearly the different pieces of hardware for my ST as I did the Amigas.

But nonetheless, relearning about GDOS and the ATARILASER drivers and installations, and conflicts and stuff is still difficult to remember. Then all the developments that have continued to today.

So yeah, advocacy is a little quiet here. I like it. But do you remember when I made the ATARI 520ST INTERNET COMPUTER OF THE FUTURE post? Boy did it come alive and boy did I get some nasty emails and posts. Call me crazy and lots of stuff.

And all I did was mention what my ST could do. But I put the post in the form of an Advertisement that one could read in 1985. No one seemed to understand this, and mistook it that the 520ST was a better internet computer than other platforms.

But clearly it is the best one from its day, as no other computer with the 1st version of the OS can get a PPP connection to the internet.

But that would be boasting;-).

It is not bad that things are quiet in advocacy, because where it really matters, where facts prevail over BS, in comp.sys.atari.st, it is busy enough for me.

But I like a little fun spirited advocacy anytime, to see who knows what, about what. My Amiga Bashing abilities have faded like my abilitie to remember the names of the devices for the Amiga that I purchased.
But 7 to 12 years ago, I certainly knew every Amiga flaw, because I lived it, and dealt with it. It wasn't perfect but Ausers would say it was.

At least the atari wasn't perfect, but no one called the be all of computing. They just put them to work.

: But we have NEW MILAN ATARIs. You have VAPOURWARE. Actually, I don't know
: what you have for new computers, I have heard, but not actually heard of
: production.

That's in part true.
Fact is, that the Amiga line evolved farther than the Atari, all the way
into '060 territory, without any clones, whereas the best Atari could make
was a 32 MHz '030 in 1990 and a 16 MHz one in '93.
Then again, I think that the Milan has a great advantage in its PCI slots,
whereas my A4000 is limited to the rather smaller and more expensive range
of Zorro cards.
That's why many of us are waiting for the BoXer clone, which, just like
the Milan, has got PCI slots and an ATX form factor.

: Yes we are in the same boat. The Good ship "LOLIPOP". About as useful.

Possibly.

: I would hope that Amiga Advocates are still active. Atari users, other than
: when prompted are pretty humble. Unfortuneately the Nature of Amiga

: would have arisen over the years. As it is the Amiga Users who pop in here
: for Advocacy aren't advocates as much as they are interested spectators,
: with something positive to offer. Hardly anything I would have remembered.

Yep, I'm myself trying to bodge together a working Atari, since I'm an
interested hobbyist. I use computers for fun, and it isn't much fun with
your average Windows box.

: I owned an A500, A3000 and couple A4000, and a handful of Toasters.
: +Laser disc recorder etc. and almost a different video card a month as I
: discovered some weren't as advertised.

Sigh.

: Much is the same for when I returned to computing. Only I chose to return
: to the weaker Atari community, and I had forgotten alot about the Atari.
: However, I never, had nearly the different pieces of hardware for my ST as
: I did the Amigas.

But were they equally capable without the add-ons?

: But nonetheless, relearning about GDOS and the ATARILASER drivers and
: installations, and conflicts and stuff is still difficult to remember.
: Then all the developments that have continued to today.

Eeek, GDOS is one PC relic if I have ever seen one. Can one single
program cause that much trouble?

: So yeah, advocacy is a little quiet here. I like it. But do you remember
: when I made the ATARI 520ST INTERNET COMPUTER OF THE FUTURE post? Boy did
: it come alive and boy did I get some nasty emails and posts. Call me crazy
: and lots of stuff.

Bah, just wait until I get my C128 on the net.

: And all I did was mention what my ST could do. But I put the post in the
: form of an Advertisement that one could read in 1985. No one seemed to
: understand this, and mistook it that the 520ST was a better internet
: computer than other platforms.

Hehe, in 1985, a VT100 would be a fine InterNet computer. Mind you, it
still is today.

: But clearly it is the best one from its day, as no other computer with the
: 1st version of the OS can get a PPP connection to the internet.

Really? I'd be surprised if KA9Q or the Commodore stack wouldn't work with
OSes 1.x.

: But that would be boasting;-).

Well, it is rather impressive.

: It is not bad that things are quiet in advocacy, because where it really
: matters, where facts prevail over BS, in comp.sys.atari.st, it is busy
: enough for me.

Well, I find csast quite a small group, but it can be rather handy to be
able to keep abreast of the entire ST Usenet activity without spending the
entire working day on it, as would be the case with the Amiga groups.

: But I like a little fun spirited advocacy anytime, to see who knows what,
: about what. My Amiga Bashing abilities have faded like my abilitie to
: remember the names of the devices for the Amiga that I purchased.
: But 7 to 12 years ago, I certainly knew every Amiga flaw, because I lived
: it, and dealt with it. It wasn't perfect but Ausers would say it was.

Well, all right, I'll admit it wasn't perfect. It was about as close to
perfection as you could get, though.

: At least the atari wasn't perfect, but no one called the be all of
: computing. They just put them to work.

Of course it wasn't perfect, that could be quite easily seen when placed
next to its big brother, but it did its work rather stably.

Bear in mind that most ST owners only use it for MIDI. That's
why only TT/Falcon/clone users seem actively involved nowadays.

No. "Chunks" is what Sinclap calls the TAF Vic President.

"Chunks" is Sinclaps Imaginary friend.

"Tifkas" is what TAF VP calls Sinclap

And Sinclair, is someone elses name, or computer, you can decide:-).

>Brian Van TIlborg <madmax@bfree.on.ca> skrev:

>People still running on plain 68000s are virtually
>unheard of in the Amiga world of today.

Anyone who had a 68000 Amiga, simply played games.

The graphics focus of the Amiga, obsoleted the usefulness of the 68000 to hardware and software developers. Therefore if you had a 68000 Amiga all you did was play games, general computing, etc.

Rendering is processor intensive. So as development progressed, Amiga users had to upgrade to later models to stay involved in the platform, or leave the platform. Serious users stayed, games players left. (my opinion).

In my opinion, there isn't any good Amiga Software, outside of graphics. It is very, very, very weak. It was in 1987. It was in 1993. I don't believe it is any different today. Therefore there isn't anything for the 68000 Amiga. That is why it is unheard of.

If you have an early Amiga, can you use the latest web browsers on the internet with the earlier OS, and kickstarts? This in itself obsoletes computers from another feature. I don't have an answer, because I am no longer involved. But I can say that it would be possible to use an A1000, A500 or box stock A2000 on the internet with PPP and current Web browser, if they supported the earlier OS. YOu will have to answer this for me.

On the Atari, things are a little different.

Alot of good powerful software developed runs on the 68000 ST.
Alot of the older software is very good and keeps you using your ST.
Many Musicians Still use their Ataris until they day they break.
Even some fix em, or try to find replacements. Possibly the biggest reason left to use an ST. Other ST users are the game players. But there is a variety of other software they can use besides games. And then still run current software, and get on the internet with a Graphical Web Browser.
The PPP connection and Web Browser supports Single TOS 1.0. This allows any ST from 1985 onwards to participate should they want to. Single TOS 1.0 machines can easily be upgraded to the Latest Magic OS.
(If only ram upgrades where so easy:-).
But now STs are cheap so they become cheap hack computers to have fun with.
I know have a Falcon and TT. But there is little that the ST doesn't do.
It just does them slower. But if you are using an ST you are not trying to be at the cutting edge of technology. And some tasks the ST just flies.
(Calamus and SLM 804Laser)
Certain things are not possible, like MP3s. But if you want to use an

Atari computer from the mid 80s for some of the more popular computer functions that a computer is used today for you can. The software developers haven't simply ignored the ST.

This is what I believe to have happened to the 68000Amigas. But I really don't know.

I couldn't tell you if there are alot of 68000 users in the .ST NG or not. Many just read, don't post. Many developments are for Falcons. The Milans may actually Snuff out the ST as people finally choose to venture futher on in TOS land or head toward the standard PC.

But as of right now, the ST can do it. Whether ST users choose to use it or not, is up to them. Infact many people with STs don't know they can connect to the internet with a Webbrowser.

>How did it cooperate with the flickerfixer?

I don't remember anyproblems with DCTV and the A3000. Only used it for about 3 weeks before moving on. I am actually curious to find one of these and see if they can be adapted to ST. Write a special driver for CAB and have a Falconlike display on the TV or Composite Monitor.
These are the kind of hacks I think of today.

>Yep, I'm myself trying to bodge together a working Atari, since I'm an
>interested hobbyist. I use computers for fun, and it isn't much fun with
>your average Windows box.

While I hate to admit how much Easier A Windows Box could make life for me. I don't look forward to being bored, or being one of the masses. I can't imagine myself having a windows conversation without some sort of barf bag handy.

Whether it be Amiga or Atari, I would get excited by a certain development. It would "Look what its doing". It would give me a charge.
But, I don't get any excitement, knowing I can run out and buy a million different off the shelf items to stick in a PC.

Now I don't know what you would need to bodge together an Atari?

>: I owned an A500, A3000 and couple A4000, and a handful of Toasters.
>: +Laser disc recorder etc. and almost a different video card a month as I
>: discovered some weren't as advertised.

>Sigh.

Lots of money invested. All the computers where stolen in 1994. I was hoping to see some animations floating around, that we could trace, but it never happened. They probably wiped out the HDs.

>But were they equally capable without the add-ons?

That's a good question. Each application must be looked upon separately.
I can only give you comparisions from what Applications I used.
I can only compare machines that I owned. And I can only express this as my

views, distorted by time, and a less than accurate memory. (oh how things change:-).

I will briefly state that the A500 was a disapointment to me. Perhaps I discovered that I didn't get excited by a soundbite in a game. But I found it useless compared to what I was using my ST for at the time. This includes Animation. (I hear murmurs:-).

It couldn't do realtime animation. The ST could. But an untrained eye might not notice the A500 slow down. But my problem with the A500 was that I couldn't use it for 5 minutes without a crash.
And my ST wasn't crash free. Some ST software was buggy, but teh Amiga. I still have no answers. That is why I sold it to a pimple faced neighbor in 1988. Perhaps it was then that I realized the Amiga I wanted was the 2000, but it was far to expensive, and that was just the starting point.

All the Addons for the Amiga where for Graphics. Accelerators and such. None of these devices made other software any better. If you weren't doing Graphics, I don't know what you would use and Amiga for. We still used the Ataris for Publishing, Adverstisements, and making the 3D objects. The A3000 couldn't run one of our 320*200*16 colour animations in real time. But the 8mhz 68000 ST could.

I have only now started playing with the Falcon. It was offered to us in 1992. My initial impression was cheap, powerful, colourful, no support, and we were already heavily invested in Amigas. So just the same. It was too little to late, for our purposes. The reason being. All Amigas where being used for single frame Animation. Frame by Frame recording. Our quality was higher and investment higher. However had the Falcon had more support and even came out 1 year sooner, it could have made a difference with regard to saving us alot of money, and the ability to do realtime animations again.

>Eeek, GDOS is one PC relic if I have ever seen one. Can one single
>program cause that much trouble?

I want it killed. Many programs avoided this disease, and provided better solutions. However they are universal solutions. So you have many different formats. Somehow GDOS made a comeback, and it makes me sick.

>Bah, just wait until I get my C128 on the net.

Well that was part of the thread. Get the C64/128s on the internet with a Graphical Web Browser.
I wanted to find a computer older than mine, with the 1ST verson OS, on the internet with a PPP connection and a graphical webbrowser.

>: And all I did was mention what my ST could do. But I put the post in the
>: form of an Advertisement that one could read in 1985. No one seemed to
>: understand this, and mistook it that the 520ST was a better internet
>: computer than other platforms.

>Hehe, in 1985, a VT100 would be a fine InterNet computer. Mind you, it
>still is today.

Well, yes. However the idea, is that if you went back in time. A 1985
dealer couldn't tell you what a web browser was. If you read earlier in th
other thread going on. The Amiga/Mac/Atari could all have been graphical
web browsing a decade or more ago.

However, could you imagine a dealer in 1985 saying, oh yes, you will be
able to use you computer in 15 years. That it will be able to adapt to the
changing computer environment? My dealer told me the ST was obsolete 2weeks
after I bought it (What a dink), but here I am able to use it.
And it didn't get stolen in the theft:-).

>: But clearly it is the best one from its day, as no other computer with the
>: 1st version of the OS can get a PPP connection to the internet.

>Really? I'd be surprised if KA9Q or the Commodore stack wouldn't work with
>OSes 1.x.

Find someone to try, and get back to me. Graphical webbrowsing and all. I
want to know about speed etc. I also want to know if there is a 19200 limit
on the A500, A1000 serial ports.

>: But that would be boasting;-).

>Well, it is rather impressive.

Gosh, golly , awe shucks :-).
Now I am embarrassed.

>Well, I find csast quite a small group, but it can be rather handy to be
>able to keep abreast of the entire ST Usenet activity without spending the
>entire working day on it, as would be the case with the Amiga groups.

I find this too. Now mind you I have never looked at the German NG. Or
anyother nationality, But I can imagine the activity is larger than the
English NG. But I have no idea.

>: But I like a little fun spirited advocacy anytime, to see who knows what,
>: about what. My Amiga Bashing abilities have faded like my abilitie to
>: remember the names of the devices for the Amiga that I purchased.
>: But 7 to 12 years ago, I certainly knew every Amiga flaw, because I lived
>: it, and dealt with it. It wasn't perfect but Ausers would say it was.

>Well, all right, I'll admit it wasn't perfect. It was about as close to
>perfection as you could get, though.

;-)

>: At least the atari wasn't perfect, but no one called the be all of
>: computing. They just put them to work.

>Of course it wasn't perfect, that could be quite easily seen when placed
>next to its big brother, but it did its work rather stably.

And usually quicker. Fewer complaints, frustrations and colours.

>/Iggy, the irregular regular

Can I be the regular irregular?

I was also thinking of yggi for a new name for me:-).

Later Brian.

I think that the Graffiti is a much newer product released after 1991. I
believe you may be thinking of BlackBelt's HAM-E system or the DCTV adaptor
by the creators of Photon Paint (the company name of which escapes me).

Sam

:>People still running on plain 68000s are virtually
:>unheard of in the Amiga world of today.

: Anyone who had a 68000 Amiga, simply played games.

I had one (in fact, it's still residing in my shelf), but I also used it
for such serious activities as DPaint and AMOS programming. Of course, it
was upgraded rather swiftly to an A1200.

: The graphics focus of the Amiga, obsoleted the usefulness of the 68000 to
: hardware and software developers. Therefore if you had a 68000 Amiga all
: you did was play games, general computing, etc.

M-hm. Or you were poor.

: Rendering is processor intensive. So as development progressed, Amiga users
: had to upgrade to later models to stay involved in the platform, or leave
: the platform. Serious users stayed, games players left. (my opinion).

Either that, or the games players turned into "serious" users.
Still, processor intensive as it is, I raytraced quite a lot on my stock
2MB A1200 without any HD on a TV. It took some time, it was painful to
look at, but it worked for a poor lad.

: In my opinion, there isn't any good Amiga Software, outside of graphics. It
: is very, very, very weak. It was in 1987. It was in 1993. I don't believe
: it is any different today. Therefore there isn't anything for the 68000
: Amiga. That is why it is unheard of.

Oh, I'm very pleased with the IBrowse web browser, for one, and the
trackers were quite capable, too. BBSes were/are another killer app. The
only real lacking field was perhaps spreadsheets and wordprocessors, which
may have a lacked a certain edge which I am blissfully unaware of, being
mostly into graphics and networking, myself.

: If you have an early Amiga, can you use the latest web browsers on the

: A500 or box stock A2000 on the internet with PPP and current Web browser,
: if they supported the earlier OS. YOu will have to answer this for me.

No, not web browsers and the such. OS 2.x is a minimum requirement for
most. This could be due to the AmigaOS implementing more services and

different programming structures in particular with OS 2, whereas the
TOS, from my point of view, remained relatively unchanged and featureless
through the years.
Nevertheless, a friend of mine has run web browsers on his A1000, though
it had to be softkicked up to OS 3.1.

: On the Atari, things are a little different.

Definitely.

: Alot of good powerful software developed runs on the 68000 ST.

Yep, but it doesn't run without some pain.

: Alot of the older software is very good and keeps you using your ST.

I'm not sure I'd agree there, but it could be due to my reluctance to
indulge into the operation of older programs.

: Many Musicians Still use their Ataris until they day they break.

Yep. I still recall seeing the Falcon MKX on display in a high street
music shop only two years ago.

: Even some fix em, or try to find replacements. Possibly the biggest reason
: left to use an ST. Other ST users are the game players. But there is a

I saw a hack in ST-Computer two years ago, using SIMMs. If only I had a
smaller soldering iron....

: But now STs are cheap so they become cheap hack computers to have fun with.

Indeed. If you are on the lookout, finding a replacement isn't that
difficult or expensive.

: I know have a Falcon and TT. But there is little that the ST doesn't do.
: It just does them slower. But if you are using an ST you are not trying to
: be at the cutting edge of technology. And some tasks the ST just flies.
: (Calamus and SLM 804Laser)

Oh, Calamus, the pain, the pain. Perhaps would it help if I had a manual,
but the GUI really is annoying.

: Certain things are not possible, like MP3s. But if you want to use an
: Atari computer from the mid 80s for some of the more popular computer
: functions that a computer is used today for you can. The software
: developers haven't simply ignored the ST.

Won't FalcAMP play MP3s?

: This is what I believe to have happened to the 68000Amigas. But I really
: don't know.

Well, that is quite true. The A1200 seems to have been much more
successful as an upgrade path than the Falcon, and since it replaced such
a vast number of A500s, the minimum standard is now set by the A1200,
which is only a revision or two from the most modern standard.

: I couldn't tell you if there are alot of 68000 users in the .ST NG or not.
: Many just read, don't post. Many developments are for Falcons. The Milans
: may actually Snuff out the ST as people finally choose to venture futher on
: in TOS land or head toward the standard PC.

In my experience, the ST users aren't that upgrade-prone, but at least the
Milans seem to trickling out at a steady rate.

: But as of right now, the ST can do it. Whether ST users choose to use it or
: not, is up to them. Infact many people with STs don't know they can connect
: to the internet with a Webbrowser.

Still not?

: have a Falconlike display on the TV or Composite Monitor.
: These are the kind of hacks I think of today.

Interesting idea, certainly, although an adapter for some dirt-cheap
stone-age VGA chip would be more useful, albeit more difficult.

:>Yep, I'm myself trying to bodge together a working Atari, since I'm an
:>interested hobbyist. I use computers for fun, and it isn't much fun with
:>your average Windows box.

: While I hate to admit how much Easier A Windows Box could make life for me.
: I don't look forward to being bored, or being one of the masses. I can't
: imagine myself having a windows conversation without some sort of barf bag
: handy.

I don't think my life would actually be easier with a Windows box. I've
used the Amiga during my entire computing life, and I get on with it
better than anything else. I just get frustrated using Macs or Windows
boxes, they're nothing but big MP3 players to me, with a clumsy interface.

: Whether it be Amiga or Atari, I would get excited by a certain development.
: It would "Look what its doing". It would give me a charge.
: But, I don't get any excitement, knowing I can run out and buy a million
: different off the shelf items to stick in a PC.

Oh, wow, look, my little super-computer-for-the-masses can do my laundry
and has got a kitchen sink fit inside for only a hundred bucks, isn't that

amazing? And it only uses 600 MHz and 128 MB of RAM! Utterly astounding!

: Now I don't know what you would need to bodge together an Atari?

A proper RF output (there is a mystery connector on mine) or an scart
cable (which I'm trying to solder, despite the devilish DIN-13 connector
on the ST).

:>: I owned an A500, A3000 and couple A4000, and a handful of Toasters.
:>: +Laser disc recorder etc. and almost a different video card a month as I
:>: discovered some weren't as advertised.

:>Sigh.

: Lots of money invested. All the computers where stolen in 1994. I was
: hoping to see some animations floating around, that we could trace, but it
: never happened. They probably wiped out the HDs.

Idiots, stealing Amigas. I wouldn't be surprised if they sold them for the
price of a Big Mac to some second-hand electronics dealer.

:>But were they equally capable without the add-ons?

: That's a good question. Each application must be looked upon separately.
: I can only give you comparisions from what Applications I used.
: I can only compare machines that I owned. And I can only express this as my

Murmur, murmur...

: It couldn't do realtime animation. The ST could. But an untrained eye might
: not notice the A500 slow down. But my problem with the A500 was that I
: couldn't use it for 5 minutes without a crash.

While I noticed the slow-down of animations, it didn't bother me, since I
found 12 fps fully acceptable.
Five minutes sounds like an exaggeration, but the Amiga has always been
rathr prone to crash, especially when low on memory.

: And my ST wasn't crash free. Some ST software was buggy, but teh Amiga. I
: still have no answers. That is why I sold it to a pimple faced neighbor in
: 1988. Perhaps it was then that I realized the Amiga I wanted was the 2000,
: but it was far to expensive, and that was just the starting point.

It really was expensive, being an A500 in a big, big box and not much
more.

: All the Addons for the Amiga where for Graphics. Accelerators and such.
: None of these devices made other software any better. If you weren't doing

: Graphics, I don't know what you would use and Amiga for. We still used the
: Ataris for Publishing, Adverstisements, and making the 3D objects. The
: A3000 couldn't run one of our 320*200*16 colour animations in real time.
: But the 8mhz 68000 ST could.

Pardon? The A3000 couldn't what?
As for upgrades, is there any software which can be improved through
hardware, save for sound and graphics? Certainly, a spreadsheet is as
happy running on an Apple II as a Pentium 2.

: I have only now started playing with the Falcon. It was offered to us in
: 1992. My initial impression was cheap, powerful, colourful, no support, and
: we were already heavily invested in Amigas. So just the same. It was too

: other thread going on. The Amiga/Mac/Atari could all have been graphical
: web browsing a decade or more ago.

Yes, more or less successfully. Definitely, in fact. B/W graphics are
sufferable when transmitted on a 2k4 line.

: However, could you imagine a dealer in 1985 saying, oh yes, you will be
: able to use you computer in 15 years. That it will be able to adapt to the
: changing computer environment? My dealer told me the ST was obsolete 2weeks
: after I bought it (What a dink), but here I am able to use it.
: And it didn't get stolen in the theft:-).

Well, perhaps should your dealer charge you some more? I'm sure that the
computer industry is less than happy to see indivudals such as you on the
net with 15-year-old machines.

:>: But clearly it is the best one from its day, as no other computer with the
:>: 1st version of the OS can get a PPP connection to the internet.

:>Really? I'd be surprised if KA9Q or the Commodore stack wouldn't work with
:>OSes 1.x.

: Find someone to try, and get back to me. Graphical webbrowsing and all. I
: want to know about speed etc. I also want to know if there is a 19200 limit
: on the A500, A1000 serial ports.

No graphics, I'm afraid.

:>: But that would be boasting;-).

:>Well, it is rather impressive.

: Gosh, golly , awe shucks :-).
: Now I am embarrassed.

Don't thank me, thank Peter Rottengarter.

:>Well, I find csast quite a small group, but it can be rather handy to be
:>able to keep abreast of the entire ST Usenet activity without spending the
:>entire working day on it, as would be the case with the Amiga groups.

: I find this too. Now mind you I have never looked at the German NG. Or
: anyother nationality, But I can imagine the activity is larger than the
: English NG. But I have no idea.

I've looked at the maus.* and fr.* groups, and I believe that they are on
about the same volume. I haven't read NeST conferences since a few years
back, though.

:>: But I like a little fun spirited advocacy anytime, to see who knows what,
:>: about what. My Amiga Bashing abilities have faded like my abilitie to
:>: remember the names of the devices for the Amiga that I purchased.
:>: But 7 to 12 years ago, I certainly knew every Amiga flaw, because I lived
:>: it, and dealt with it. It wasn't perfect but Ausers would say it was.

:>Well, all right, I'll admit it wasn't perfect. It was about as close to
:>perfection as you could get, though.

: ;-)

Seriously!

:>: At least the atari wasn't perfect, but no one called the be all of
:>: computing. They just put them to work.

:>Of course it wasn't perfect, that could be quite easily seen when placed
:>next to its big brother, but it did its work rather stably.

: And usually quicker. Fewer complaints, frustrations and colours.

Cheap and cheerful.

:>/Iggy, the irregular regular

: Can I be the regular irregular?

I haven't copyrighted that one yet, so do so.

: I was also thinking of yggi for a new name for me:-).

Don't blame me, blame the parental units.

But it still runs.

The same cannot be said of Amiga: anything below a 1200 gets you
into a _lot_ of troubles, if it runs at all. On Atari, an ST is
just a slower TT/Falcon but most software still runs.

> The A1200 seems to have been much more successful as an

Bear in mind what applications most people were interrested in,
on Atari: MIDI sequencing and DTP, both of which run perfectly
fine on a plain ST. There was no compelling reason to upgrade.

> : In fact many people with STs don't know they can connect
> : it to the internet with a Webbrowser.
>
> Still not?

How could they know? Everybody told them that after Atari bailed
out of the market, the platform was dead. They just hung on to
their ST because it was still a good DTP/MIDI box and blindly
bought a PC like they were told to when Internet happened.

> : Find someone to try, and get back to me. Graphical webbrowsing and all. I

Well, there you go.

An ST can still browse graphicaly, while an Amiga 500/1000 can't.
Sure, it is awfully slower than a TT/Falcon, but the point is,
it's still usable.

Anyhow, having also experienced both Amiga and Atari, my opinion:

Amiga: the video toaster platform.
Atari: the DTP and MIDI platform.

Any other application of either platform is purely incidental.

Obviously, since AmigaOS is kernel-based, it was easier to boost it into becoming rather close to Linux standards and the upgrade path towards the 68020 minimum was a more obvious choice.

On Atari, the divergeance created since MagiC was invented almost made it impossible to upgrade to the UNIX base provided by MiNT; there were too many disagreements in using the new standard that was adopted by Atari and many prefered coding for MagiC.

In retrospect, this is what is killing the platform, more than what minimal hardware base Atari users are running on.

I have been testing my Advocacy posts in the thread "not much advocating going on." The thread has stopped appearing to me. I would upload the posts and they not appear. Today my NS showed my that there were 6 messages. When I downloaded them, they were zero byte files. So I reset my counter back 50 messages. Sure enough last 6 come up as zeros, and my other posts from a day or so ago, didn't appear to me the second time around.

Two questions?
Did any posts from me with the words TEST get through?

Has their been anymore posts in advocacy in hte last 24hours?

Later Brian.

I had a 6 MB 020 STE, the additional MB was fastram for the 020. The
020 was an upgrade board. This was one fast ST... For raw CPU it kicked
the falcons arse :) it got 150% on the falcon.

:>
:> No graphics, I'm afraid.

: Well, there you go.

Yes, there I go. With a new OS, which in fact runs on every machine since
'85, it is very much possible, though.

: An ST can still browse graphicaly, while an Amiga 500/1000 can't.

Correction: With the first OS, the Amy can't.

: Sure, it is awfully slower than a TT/Falcon, but the point is,
: it's still usable.

Well, at least given memory.

: Anyhow, having also experienced both Amiga and Atari, my opinion:

: Amiga: the video toaster platform.
: Atari: the DTP and MIDI platform.

Yep.

: Any other application of either platform is purely incidental.

I beg to differ. The Amiga software market wasn't entirely made up by the
Videotoaster, which was only applicable in NTSC markets. The graphics
software spanned a much wider scape.

: Obviously, since AmigaOS is kernel-based, it was easier to boost
: it into becoming rather close to Linux standards and the upgrade
: path towards the 68020 minimum was a more obvious choice.

Well, the Amiga kernel is very much different from the Linux one, and the
ST had the rather ingenious BSD replacement kernel system, MiNT.

: On Atari, the divergeance created since MagiC was invented almost
: made it impossible to upgrade to the UNIX base provided by MiNT;
: there were too many disagreements in using the new standard that
: was adopted by Atari and many prefered coding for MagiC.

MiNT seems like an aqfully nice system if you like the superficial
qualities of TOS, but feel the need of more powerful guts, but it is at
the same time a far cry from the otherwise Mac-like operation of the
Atari. MagiC is perhaps more in line with a more polished evolution of
TOS, which of course should attract the not-so-hardcore users. Of course,
this fragmentation of such a small market isn't all that beneficial.

: In retrospect, this is what is killing the platform, more than
: what minimal hardware base Atari users are running on.

You're right, it can be quite fatal.

If you mean the Veloce+, it never was sold outside UK since TUS, like Atari before them, never knew about marketing; thier web site is basically useless.

Anyhow, the description of the "fully loaded STE" I gave with TOS 2.06 and 4 MB, plus internal IDE drive, was in response to the basic 1 MB TOS 1.xx that make people too easily dismiss the ST.

Sorry? Nope, development went on, despite what Amiga/PC users
would like to think. The only thing is, some clever programming
docs by Atari allowed programmers to ensure most software would
remain backwards-compatible with any TOS/AES version.

Because they beleived what people told them: Atari is dead.

> : Sure, it is awfully slower than a TT/Falcon, but the point is,

Nope, on a plain 4 MB ST, in singleTOS, MultiTOS or Magic.

Hell no! MiNT was _not_ meant to result in a commandline OS; it
was only meant as an "under the hood" facility for programmers.

> MagiC is perhaps more in line with a more polished evolution
> of TOS, which of course should attract the not-so-hardcore
> users.

If Magic supported all the protocols and hardware MiNT did, in a
completely easy-to-use way, I might use it. In practice, it does
not support foreign keyboards (except for UK and US), does not
support the Riebl card I have for cable-net and school intranet,
doesn't have _any_ ssh client, has a CAB.OVL without SSL, etc.

In a nutshell: MiNT + N.AES + Thing does it, Magic could not.

> : In retrospect, this is what is killing the platform, more than

Indeed. If only Andreas Kromke had upgraded MagiC to support
MiNT and AES 4.1 functions - which Atari officially supported,
there would at least be some amount of compatibility.

Today, people are connecting 100baseT interfaces to what is
effectively a glorified parallel port. Attaching an ST to
a LAN doesn't seem quite as bad of a hack in this light.

>would be no happier if two million A500 owners decided to link their old 1

Basic networking applications should not find themselves hindered
by running on an A500. Such applications really aren't that
interesting. They only tend to become more 'interesting' due to
bloat, featuritis and the proliferation of proprietary protocols
through things like plugins that don't really create new functionality
but exclude classes of users through binary incompatibility (with the
pluggin).

It doesn't really matter. I doubt she would be able to
tell the difference if it didn't. The distinction is
certainly far to esoteric for her to be aware of it.

A 33mhz 040 would likely do just as well for such a user.

Anything 030 or better with a trim OS should be able to go toe
to toe with anything else currently available. The real issues
are 3rd part support and perhaps outdated media hardware.

Did you ever spend time as a Windows user? It's the sort of
experience that gives the old Atarian or Commie a renewed
respect for their older machines. Of all the failings of my
ST, the OS eating itself wasn't one of them. Windows conditioned
me to keep a copy of my OS media on the main disk for frequent
reinstall.

Exactly. Commercial Unices like IRIX and Solaris all come with
an excellent GUI that makes you forget about the kernel and CLI
tools running under the hood.

The same concept applies to MiNT with MultiTOS or with N.AES and
Thing as a desktop.

This is exactly why I have been advocating that remaining Atari users who need thei machine for more than just DTP or MIDI should upgrade to a TT or Falcon and that programmers should consider a TT or Falcon a minimal support base, the same way an A1200 is the bare minimum on Amiga.

> Well, that was before Marc Andreesen's arrival. Trust me,

Exactly my point, thank you. So, why isn't everybody intent on
networking via Atari upgraduing to a TT or Falcon yet?

It may not be necessary to go toe to to with any contemporary
machine. That sort of computational muscle may simply not be
necessary.

Besides, you can get a basic PC for ~$300. Many may be disinclined
to pay more for some TT clone.

It definitely is, if you intend on using it toe to toe.

> Besides, you can get a basic PC for ~$300. Many may be disinclined
> to pay more for some TT clone.

You're missing the point here.

It's about wether development of Atari and Amiga should be held
back because everything should remain ST or A500 compatible, or
if people who are still serious about their daily usage of either
platform will face the fact that if you want today's features,
you must upgrade to something better equipped: a TT or A1200.

Hardly. Most people don't exploit the full potential
of their machines these days and much of what they
do exploit is more due to the waste inherent in current
way of building applications.

>
>> Besides, you can get a basic PC for ~$300. Many may be disinclined

>You're missing the point here.

No, you are. It's getting to the point where emulating a
Falcon would be more cost effective than making actual
clone hardware. By 'forcing' users that would benefit from
the fruits of further development, you're removing from them
one of the more obvious benefits of remaining Atarians: cost.

>

You've not really given anyone any reason to believe that
todays computing tasks inherently require beefier hardware.
For the most part, what people do today are the same things
they did 10 years ago. Much of it is just done less efficiently.

People tend to forget that at one time a machine comparable to
an Atari ST was used by multiple people concurrently to get useful
work done.

This link might be of some interest.

On Atari, if you wanna swim with the rest of them, you _have_
to exploit the full potential.

Notice I said upgrading to a TT/Falcon, not buying a clone.

> By 'forcing' users that would benefit from the fruits of

TT/Falcons go for less than peanuts these days. It's very cheap.

I have. Plenty of times, recently. Several people
independantly came up with the same conclusions too.

> For the most part, what people do today are the same things
> they did 10 years ago. Much of it is just done less efficiently.

On PC, definitely. On Atari, much of what is done today was
beleived impossible just a couple of years ago. We _are_ pushing
the envelope, but pushing the Atari hardware to the limit.

> People tend to forget that at one time a machine comparable to
> an Atari ST was used by multiple people concurrently to get useful
> work done.

An ST still is usefull, for DTP or MIDI. Beyond that, forget it;
you need real CPU horsepower and lots or memory, possibly an FPU.
This really does mean a TT or a heavily hot-roded Falcon.

Btw, I seem to recall that you are not using Atari anymore?
How could you make any assessment on what one needs for today's
TOS applications, since you're not a user?

Depends if you mean by moving up to Falcon etc. or simply upgrading an
existing machine. According to The Upgrade Shop a lot of STe users have
upgraded to Veloce+ but I appreciate that that is a very small percentage
of actual users worldwide.

>Here in NA, many dealers, left long ago. No Mags where distributed, anywhere,

We're fortunate here in the UK, there are a number of ISPs who support
Atari, Zetnet being one of the best IMHO. For example they have several
specific in house Atari newsgroups that you are encourage to join. They
regularly advertised in the Atari Computing but now that that has closed
down.....

I don't quite understand this so if you could please explain to me...

Why do you need an ISP that supports Atari specifically?. I can connect to
any ISP with my Amiga. Miami configures everything automatically, all that
is needed is the dial-in number, username and password.

Most ISP's support this feature, and even if they don't, manual
configuration is no different on an Amiga then for a PC or Mac.

I'm just curious as to why you would want Atari support specifically?.

Regards,

Clockmeister.

: Why do you need an ISP that supports Atari specifically?. I can connect to
: _any_ ISP with my Amiga. Miami configures everything automatically, all that
: is needed is the dial-in number, username and password.

Well, there is in fact an Amiga-specific ISP in the UK; WireNet. An
inexperienced user can often run into troubles, and when the people in the
support have just had a crash-course in the Windows remote dialer, how
would they know how to configure Miami, AmiTCP, IBrowse or Thor?
Besides, STiNG isn't quite as simple as Miami is reputed to be (I haven't
tried it myself, since it seems so lame^H^H^H^HMac-like, and I have a
working AmiTCP setup anyway).

: Most ISP's support this feature, and even if they don't, manual
: configuration is no different on an Amiga then for a PC or Mac.

Mind you, since the Mac and PC users are supplied with already set-up
config files on their CDs, the staff will not necessarily know how to
setup the stack, not to mention CAB, OVLs and other software.

: Where were you gonna buy ST Format, when all North-American
: newsstands and dealers don't carry anything Atari-related
: anymore?

I have no idea, it was imported into Interpress shops here. After its
demise, I've been able to buy ST Computer until last month, when it ceased
shop distribution in order to become subscription-only.

:> and once on the net with their PCs, how come they don't go
:> looking for Atari software?

: Because they beleived what people told them: Atari is dead.

That's not the spirit!

:> : Sure, it is awfully slower than a TT/Falcon, but the point is,
:> : it's still usable.
:>
:> Well, at least given memory.

: Nope, on a plain 4 MB ST, in singleTOS, MultiTOS or Magic.

Since when was a 4 MB ST "plain"? When talking about a plain ST, I'm
refering to a base-configuration 520 or 1040. With 4 MB of memory, I'm
well aware that operation is rather smooth.

:> Well, the Amiga kernel is very much different from the Linux one, and the
:> ST had the rather ingenious BSD replacement kernel system, MiNT.
:>
:> : On Atari, the divergeance created since MagiC was invented almost
:> : made it impossible to upgrade to the UNIX base provided by MiNT;
:> : there were too many disagreements in using the new standard that
:> : was adopted by Atari and many prefered coding for MagiC.
:>
:> MiNT seems like an awfully nice system if you like the
:> superficial qualities of TOS, but feel the need of more
:> powerful guts, but it is at the same time a far cry from the
:> otherwise Mac-like operation of the Atari.

: Hell no! MiNT was _not_ meant to result in a commandline OS; it
: was only meant as an "under the hood" facility for programmers.

Well, it seems to be very much used for CLI tasks, what with all the
command-line tool recompiled for MiNT.

:> MagiC is perhaps more in line with a more polished evolution
:> of TOS, which of course should attract the not-so-hardcore
:> users.

: If Magic supported all the protocols and hardware MiNT did, in a
: completely easy-to-use way, I might use it. In practice, it does
: _not_ support foreign keyboards (except for UK and US), does not
: support the Riebl card I have for cable-net and school intranet,
: doesn't have _any_ ssh client, has a CAB.OVL without SSL, etc.

Exactly, it lacks "guts". It does have a German keyboard, too, though,
doesn't it?

: In a nutshell: MiNT + N.AES + Thing does it, Magic could not.

I trust you, but many do prefer MagiC nevertheless, and AFAIK, it is more
Atari-like than MiNT.

:> : In retrospect, this is what is killing the platform, more than
:> : what minimal hardware base Atari users are running on.
:>
:> Of course, this fragmentation of such a small market isn't
:> all that beneficial. You're right, it can be quite fatal.

: Indeed. If only Andreas Kromke had upgraded MagiC to support
: MiNT and AES 4.1 functions - which Atari officially supported,
: there would at least be some amount of compatibility.

I'm not at all impressed by the "do it yourself" attitude of ASH, they
seem to have solutions of their own for everything, not to mention
interdependence of their applications.

Actually GEM by itself was capable of doing 16K colors at least.
It was the Atari hardware that was limited (primarily by engineering)
to fewer colors.

>It would seem to me, as though the programmers would have to do a lot of
>work by themselves, instead of relying on system resources, or upgrading

Something like a small effective pallete will only make more
obvious the skills (or lack thereof) of poor or lazy artists
or designers. Even in systems that have graphics capabilities
far exceeding the Amiga one sees failed art squandering the
potential of good hardware.

There were plain 4M ST's, they were called Megas.

>refering to a base-configuration 520 or 1040. With 4 MB of memory, I'm
>well aware that operation is rather smooth.

There were plenty of STs for which 2M/4M wasn't a hacked configuration.

[deletia]

That's more a side effect of GNU than anything else.

The like of Irix are built on top of such tools, yet
Irix and it's cousins are hardly limited merely to them
(grep, awk, xargs & friends).

[deletia]

Bullocks. 'PC's have nearly always been collections of random
spare parts driven by an OS created more for market penetration
then delivering quality OS services.

The net, especially the web was meant to be open ground in which
any system using standard protocols could communicate effectively.

Atari's and Amigas have the benefit of being simple, consistent
and relatively deviod of internal 'corruptable state'.

The Windows registry on FAT32 is not something any novice consumer
should be subjected to.

Actually, a real artist is expected to effectivly 'create his
own paint'. This is just part of the craft. Computer rendering
is really no different in this regard.

[deletia]

They were just a little newer, but you still just pulled them
out of the box an plugged them in. There was no particular
voodoo to them.

Funny, I had one. Limiting one's judgements regarding a platform
to the very earliest models available is hardly honest.

Ok, I accept that. I have been setting up ISP connections for other people
because they couldn't figure it out, or couldn't get things working
properly. I assumed Atari/Amiga people to be smart enough to figure stuff

like that out for themselves ;-)
(Most Atari/Amiga users know their systems pretty well by now)

What potential? Anything compute bound is going to get
bogged down on a TT clone. The rest of which is more user
bound really isn't that hindered by older hardware really.
If you toss the 'paperclip' you can get a lot done on
what an ST has to offer.

There are pretty much two states that my current machine
operates at (a 400Mhz machine incidentally): near zero
cpu utilization or a cpu load that no TT clone would be
able to keep up with.

The 'clone that can run faster than a Falcon while emulating
GEM' is STILL going to be cheaper. 32M 300Mhz PII clones
represent todays cut-rate bargain basement in PC's.

Infact, I just might get a PIA and slap a GEMulator in it now
that you stumbled me onto the idea...

Not that I've seen. It seems like there's plenty of of
demand to go along with the supply. I've seen older alpha
systems go for less than 030 Ataris.

>What clock frequency, pray tell?

Apparently, and I quote, it's running at 16Mhz with zero wait states.
Allied to this is 32-bit TOS 2.06 and 32-bit 2Mb (in my case) Fast TT
RAM, a 32-bit data bus and can process data with a maximum of 21Mb/sec
against 4Mb/sec for a standard STe. Again, I have to admit that I don't
fully understand all the details,but I'm learning!

>surely it can't be that difficult.

No, but isn't that the point? People have to get on the 'net in the first
place to find them but they don't know you can do it with an Atari or an
Amiga so they sell them and get a PC. Even then they will probably only
stumble across the relevant sites whilst looking for something else.

>
>:>I also don't consider the ST to be the poor mans Amiga. If someone wanted to

>My, that's an interesting sales policy among Atari dealers.

Yes especially as he sold both the Amiga and Atari. In fact there was on
out of town store that until very recently was still selling Atari and
Amiga games as well as mice and so on in its very small computer area.

Precisely, unless you're a member of the DOS-of-the-month club,
you're going to be given the cold shoudler by vendors that don't
think that your money is green enough.

This isn't an Atari problem. This is a 'free market' problem.

[deletia]
>If you ask a question here, the first thing that you are asked is are your

Same thing... Opera blows either out of the water. Yet lazy
vendors will give you the cold shoulder for 'daring' to use
what is most suitable by your estimation rather than what
everyone else uses.

This isn't an Atari problem. This is a 'free market' problem.

Actually, I was refering to USB. It's about as fast as a
modern centronics interface and in many cases put to
similar use (printer+zipdrive+scanner).

An ACSI->USB host adaptor could be quite an interesting beast.

As long as you've got enough ram to avoid swapping to disk
and bringing the system to a crawl then even 16 would likely
do when the biggest bottleneck in the system is the end user.

Although, something as slow as 33Mhz could be a problem when
dealing with compressed media formats (mp3, sorenson qt, etc).

Video and audio primarily. I've got a CRUSTY isa sound card
and it does CD quality audio. A similarly crusty vidcard
could manage 1600x1200 65K color easy and mebbe even manage
some decent 3D acceleration.

This is the value of a core OS that can be burned into ROM.

Are there any GEM replacements that allow the execution of
680x0 binaries on x86 hardware ala a PPC Mac?

GEM sitting on top of a GEMDOS layer over POSIX running on
a stock PPC or x86 might end up being a more efficient
method of deploying a TT clone.

CAB is very much a stripped-down browser, yet it taxes an ST's
resources to the limit. On TT or Falcon, it becomes usable.
Also, if you wanna be able to lauch the mailer, FTP or Telnet,
you need multi-tasking, but CAB already wastes 2 MB on its own,
not to mention CPU resources.

There have been _many_ video cards for the MEGA (on megabus),
MEGA-STE and TT (VME bus) and Falcon (CPU expnasion bus). A
Falcon can already do CD quality audio recording and it could
do it at a time when it was only a dream on Mac/PC, so can a
TT using the StarTrack VME card.

Will you stop it with the clone bullshit already?!! If you
really insist upon running Atari software on top of something
else, buy a copy of MagicMac or MagicPC and get it over with.

Either way, you're deviating from the thread's discussion, which
was about determining wether a plain ST upgraded to TOS 2.06 and
4 MB of ram can still be usefull, or if people are better off by
getting themselves a TT/Falcon to raise the minimum support base.

Yes, but clumsily. MagiCPC does it. There is also STonX on UNIX which
allows for a rather smooth integration between the X and TOS environments.

: GEM sitting on top of a GEMDOS layer over POSIX running on
: a stock PPC or x86 might end up being a more efficient
: method of deploying a TT clone.

I wouldn't agree, at least not for the x86. MagiCMac comes close, but all
the PC emulation alternatives which I've tried have been uneven and
clumsy. I don't think that emulation really can replace the real thing.
Well, except for MagiCMac.

that's pretty poor, they only sold 1,350 Macs. Proof positive that
TiFKAS pretends to be an "Apple Power Rep" - not only can't he spell, he
can't even do up numbers properly....

which web site did you get the info from, TiFKAS? any moron can get that.

and you will never see any "Atari Jihads", cause they don't exist....

One point thirtyfive Macs sold in Q1? That's hardly impressive,
considering that 50 Milans are sold every month.
Besides, how do you sell 0,35 of a computer? Was it just a motherboard for
a home-hacker?

$30 flatbed scanners and $50 cameras come to mind as well
as other things likely available in USB variants but not
Zorro II. The same goes for firewire.

There's nothing tying GEM to Atari's or the 680x0.
This was the case even when GEM was taken relatively
seriously.

The problem with both of these is that they incur the overhead
of their respective GUI's. X and Win32 are both bloated pigs
compared to GEM. They rather eliminate most of the point of
running an austere GUI.

jpeg and friends are, the net itself isn't. I started out on t
he net using an Atari 520STm. I moved on because I like to do
12 things at once and otherwise exploit hardware that Atari's d
on't have.

However, I still appreciate a minimalist approach to applications
desing. It forces things to be simple, thus easier while reducing
resource usage. Current software engineering practices tend to
undo Moore's Law as much as they possibly can.

>

Want to watch Sporting Events?--Movies?--Pay-Per-View??

*This is the Famous R-O Shack TV Descrambler
You can assemble it from Radio Shack parts for about $12 to $15.

We Send You:
1, E-Z To follow Assembly Instructions.
2. E-Z To read Original Drawings.
3. Total Parts List.

**** PLUS SOMETHING NEW YOU MUST HAVE! ****
Something you can't do without.

THE UP-TO-DATE 6 PAGE REPORT:
USING A DESCRAMBLER LEGALLY

Warning: You should not build a TV Descrambler without
reading this report first.

This descrambler works on Fiber, TCI, Jarrod
and satellite systems (not DSS).The signal
descrambles right at the box and does
not move back through the line so the
cable company will not detect it

This Box will everywhere in the USA plus England,
Brazil, Canada and other countries!

We mail out all orders within 24 hours of receiving them.

You get the complete 6 page report and instruction package including the instruction plans, the easy to follow diagram, and most important of all the "Using a Descrambler LEGALLY Report all for just--$10.00

Fill out form below and send it,
along with your $10.00 payment to:

Cabletron FREE-TV

Correct but the internet if full of Multi Media Apps that an ST cannot do.
Java, VideoStream, RealAudio, and these are now normal computing practices
on the internet for any new computer purchaser.

As for doing 12 things at once, Well, let me see here.
ST/w/Magic/Email/FTP/IRC/mICQ/NEWS/WEBBrowsing ect can all be done at once.
Nothing I can't do on a Falcon/TT/ or Bloatware machine. Now try this.
I can run Multiple MPGs in different windows on an ST. My friends PC
wouldn't do this, but I don't know why. Could have been him:-).

I have ran multiple videos in a Single Tos ST. This is very tricky to run
in a window at 8mhz. My ST is a 520STm as well. 2.5meg ram.

> However, I still appreciate a minimalist approach to applications
> desing. It forces things to be simple, thus easier while reducing
> resource usage. Current software engineering practices tend to
> undo Moore's Law as much as they possibly can.

More reason to support the ST. The ST is software that runs today must be
optimised. It is very fast solid software. Same can be said for software
that is optimised on the Falcon and TT.

>>However I do understand you argument with regard to most other applications.
>>This is very much true. However, Todays Games are very Graphic Intensive,
>>and you cannot get this out of a Falcon or a TT.

> You can't get this out of a cheap x86 clone either. Enter the
> consoles...

Actually you can't get this out of a 2 year old 233mhz PC either. Lots of
Games are asking for even more as a minimum. Leave the ratrace for the PCs
and keep supporting the ST:-). It is a good base minimum Standard.

Most new users showing up on comp.sys.atari.st are showing up with Falcons
or TTs but STs.

>>Now taking into account that Computer Application users haven't changed
>>much in 10 years, supports the usage of the Atari ST!!!

> Yup.

I knew we were on the same page:-).

Nothing to do with it. Slow table formatting and text rastering.

I remember trying to get info from them once, they didn't respond to email, their web site had one download (from what i remember) and they only advertised in atari computing (there isn't many other places to go mind you :).

They could have tried america or germany, from what I gather, these were the two more popular countries for ataris.

> Anyhow, the description of the "fully loaded STE" I gave with TOS
> 2.06 and 4 MB, plus internal IDE drive, was in response to the

I had that once :)

My STE was a seriously fast machine (by atari standards) after the 020 was fitted.

You have to remember though that there were other upgrades available, like the Pak 030 upgrade, or even just the one that drove the 68000 up to something like 30 MHz, must have been good for keeping your hands warm when typing :)

Germany Popular. North America not popular. But that doesn't mean there
wouldn't be North American Purchases if the product was available.

Germany, France and UK, in that order. Other places saw only
marginal popularity.

Which were also only available in their country of origin.
Exports were a rather marginal phenomenon, unfortunately.

But I want to know about this maxxed out Amiga. I just didn't ask because I figured he would eventually tell us.

Now, of anyone, Martin, you could have given a little direction regarding TT upgrades and accessories.

So, I suggest that the original poster of this thread go to your website below. Unfortuneately the org server is down right now, and I don't have the original URL handy.

His first mistake was to try carrying on a "learning" conversation with Brad. He is in the business to make money, and if you know what to ask, will answer your questions. I would guess the guy gets quite a few calls a day, and to spend time explaining what is readily available else where probably got him a little hot. As always, RTFM, RTFNG in this case:).

Mikey

First and formost hello everyone,

I think I might have offended someone in my quest for Atari knowledge, namely someone from Best Computers (Actually I ended up slamming down the phone in disgust from the bashing I was getting).

Let me explain my problem. I have long admired the Atari and its capabilities particularly the TT030. Unfortunately, I did not have the resourecs when they were being produced new and then when I had the cash, they were no longer being produced.

Now after extensive searching for the right model I purchased one off ebay that is proving to be one nice machine.

The problem that I'm having is that I cannot get anyone who is a die hard Atari user to help me learn more about the machine and to max it out.

The conversation I had today with the gentleman from Best started out with me asking how can I expand my machine to the latest and greatest goodies and it turned into an all out bashing of my ignorance of how the machine was so great for its time. I know the machines are cool and were ahead of their time, but please tell me about all the new cool stuff it can do today and all the new gizmos available or even must have old stuff. Help me out.

Just my mere mentioning that I come from the Amiga and Solaris camp seemed to just enrage the man. I mean no offense, but if the platform is so good I'd just expect more help from those who use it rather than the Amiga bashing I've received so far.

Now for the help that I need. I simply would like the most versitile Atari I can build. That can't be so hard to understand. The guy asked me what I was planning to run on it and that is a valid question, but I want to be able to run whatever the heck I decide to run. My Amiga for example is possibly one of the most tricked out machines period in terms of Amigas. My Solaris, NeXTStation, HP, and Linux boxes are also very trick, but they are all that way because of the help and friendships I developed in those groups, but the Atari crowd seems to be a tough nut to crack.

Please help.

Again hello, I'm late to the party, but new blood can only be a good thing.

Perhaps it's easier to bash the Amiga then to actually prove that an Atari
is better. Just saying...

>
>
> Now for the help that I need. I simply would like the most versitile

Depending on whether you're into MIDI, DTP or whatever determines which
upgrades are better suited to your needs. For instance, if all you want to
do is play/create MP3's it's really no use paying big dollars for a graphics

card when all you really need raw numbercrunching performance.

Ofcourse, if you want it all and your pockets are deep then it doesn't
really matter.

My Amiga for example
> is possibly one of the most tricked out machines period in terms of
> Amigas. My Solaris, NeXTStation, HP, and Linux boxes are also very trick,

The mention of the Amiga name sometimes causes some "interesting" responses
in this group...

Nice diverse range of systems you have there BTW.

> Please help.
>

I find this hard to believe. Did you try comp.sys.atari.st?
Did you try comp.sys.atari.tech.?

Information on the TT is readily given.

This is the advocacy forum.
Who knows what you get here.

>The conversation I had today with the gentleman from Best started out with
>me asking how can I expand my machine to the latest and greatest goodies
>and it turned into an all out bashing of my ignorance of how the machine
>was so great for its time. I know the machines are cool and were ahead of

Well, what do you want to do? What do you want? 128Meg of Fast Ram, 10Meg
of ST ram? Ethernet? Graphics Cards (difficult to find now)?
Accelarators? Best and B&C have large lists of TT stuff on their Webpages.
Generally it is expensive. But where else other than the used market can
you find the stuff in North America.

Are you looking for midi devices?

How much ram do you have? HardDrive? Do you have a graphics card?

Versus me tell you what a TT can do, perhaps it would be a shorter list if you stated what you wanted to do with it. If not happy you could sell it:-).

>Just my mere mentioning that I come from the Amiga and Solaris camp seemed
>to just enrage the man. I mean no offense, but if the platform is so good
>I'd just expect more help from those who use it rather than the Amiga
>bashing I've received so far.

Interesting? I would think after 15 years of Amiga bashing Atari users would have some pretty worn out arguments. Both platforms are incredibly small today, being a useful computers for knowledgeable people and no longer the mass marketing devices they once where considered.

However I can bash an Amiga if you like:-).

>Now for the help that I need. I simply would like the most versitile
>Atari I can build. That can't be so hard to understand. The guy asked me
>what I was planning to run on it and that is a valid question, but I want
>to be able to run whatever the heck I decide to run.

Then I suggest you give a hint of what you are deciding to run. Publishing, Midi, or Linux? Mint, Magic, Geneva, or TOS. Internet software, current software old software or public domain software?
It is a valid question and it appears you have left the door wide open and are remain uncommitted. If you just want to pump hardware into a TT and build a superTT then I can't see how you could have ran into trouble at Best. Although I have never spoke with them.

> My Amiga for example
>is possibly one of the most tricked out machines period in terms of
>Amigas. My Solaris, NeXTStation, HP, and Linux boxes are also very trick,
>but they are all that way because of the help and friendships I developed
>in those groups, but the Atari crowd seems to be a tough nut to crack.

I think I may have spoken with you about 2 years ago when I first connected my ST to the internet. You seem like a hardware enthusiast. If I am correct you had a 68000 based webpage. If I am incorrect forgive the speculation. I just remember speaking to another user with a similar combination of computers and No Ataris, but was semi interested in them.

>Please help.

>Again hello, I'm late to the party, but new blood can only be a good
>thing.

The party is generally small and friendly. I suggest you try the other NG for more specific information.
Give some details on the TT you own. There is so much midi hardware available it is just stupid. To some this is very powerful, to others it is just not useful to their application. A powerful computer is different in each persons eyes. No matter what the hardware it can't make up for insufficient supporting software. For others the software can make the computer more powerful than any hardware enhancements.

Besides, you may become just as interested in the Older Hades 060s and the newer Milan II 060s as well.

So, I am doin my best to help. But even building a TT to more current specs may not be affordable to have as simple a hardware toy.
You may want to play around with what you first have then determine what it is lacking in its current form. Like what software do you have and is the software 10-15 years old when NEW software can be had.

Later Brian.

You drew attention to an off-topic question with your reply which is a bit
ironic, no?. Besides, at least one other person in this group is interested
in what a "maxxed" out Amiga consists of.

Regards,

Clockmeister.

But this does. I can't email you or get to your webpage as long as you use the Atari.org. I've lost the real URL. All mail I send you bounces back to me.

I was thinking of a message like... "why don't you jump in lake Baikel" crap, I hope thats the name. Well, theres plenty of cold lakes in Finland to jump in. No need to cross the border. Here are a few to consider.

Pyhajarvi, Paijanne, Saimaa, Orivesi and finally lake Ladoga.

Cut a hole in the ice. Jump in and cool off. This could take awhile, so don't worry if you are still hot, and the hole cut above you is freezing over.

P.S. Please send Reibel Card and Ram upgrade to fellow Atarian in Brantford, Canada before completing your mission. By the time it arrives, I will know for certain that you have cooled off significantly.

>> Now, of anyone, Martin, you could have given a little

Good enough. But seriously, I would like to email you. And get the proper URL. So if you wouldn't mind posting this here. I became to dependant on that Org Server. Now its biting me.

I think I am done toying with the Falcon and I am going to spend more time with he TT. Hopefully will have some more ST toys before years end. Then look out you ST basher.

Brian.

Lake Saimaa is right here, in front of the window. ;-)

Might as well wait for Mario Becroft's SCSI-Ethernet adapter.
I hear the hardware is pretty much ready, he's up to software
drivers programming now, I beleive.

Ram upgrades, you should still be able to find some Atari 16 MB
TT-RAM cards easily. For ST-RAM, Bernie Diotte can upgrade the
2 MB cards, for a price. His address is on my page, which is at
http://TT030.tripod.com or at the atari.org URL, when it works.

> Good enough. But seriously, I would like to email you.

E-mail is on the web site.

It's biting a lot of us. Honestly, the atari.org idea sounds
nice, but apparently either the hardware they use or the guys
maintaining it don't work.

Not at all. Your total is 6MB.

When you boot the TT it does a RAM check. The first line is ST-RAM and the second is TT-RAM. ST-RAM is accessed at slower speed to maintain some form of timimng/buswidth compatibility with older ST software, but TT-RAM can be accessed at full speed/width, including the 68030 burst mode. You could get a 3rd party RAM board to allow you to have tons of memory (256MB?). The most important thing you will need is a Control Panel to change the RAM preference of software. Most software will default to using ST-RAM but you can tell software to load into and run from TT-RAM to boost speed (and boy it does!)

Hope this helps, seems like few others in this thread have offered much thus far...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Not really.

ST-RAM in mainly used by the hardware as a buffer, such as for
the video hardware, which means it is subject to a _lot_ of
hardware interrupts, while TT-RAM can _only_ be used to store
program data.

It is great when that happens isn't it!. Reminds me of the time when my
friend needed a Pascal program to be compiled for a school project. His PC
was broken, so I offered to help out... with my Amiga 1000!.

He was quite surprised when his program compiled and saved using the old PC
emulator program from C=, running Borland Turbo Pascal.
Suddenly that "old, useless relic" as he used to call it gained a lot more
respect because it saved his neck!.

Since the above confirms you have no experience whatsoever of
newer Atari hardware with higher performances and more memory,
you are in NO position to comment on wether upgrading to a
TT/Falcon provides any real benefits for real Atari users.

The whole "what's an ST good for ..." and "not much advocacy..."
threads, plus several others during the holidays.

> It's not like I don't have access to a Falcon, a friend has one

That does not mean you have daily experience of the difference
between an ST and a TT/Falcon.

Source record: 2326

Apple will post their results today with expecations of better than expected. Looks like sales were phenominal(sp?) in Canada and Germany despite being the home of the new Milan. Apple's transition as a consumer company is nearly complete..Watch out..

The "Not much advocacy" thread was mine, but it started as a tongue in cheek
season's greeting. It had the desired result of producing some conversation
in this group did it not?. It had been pretty dead in this forum.

> > It's not like I don't have access to a Falcon, a friend has one
>
> That does not mean you have daily experience of the difference
> between an ST and a TT/Falcon.

And how many Atari users are quite prepared to make assumptions on modern
day Amiga's when they have absolutely _no_ experience at all?. At least I
can in part relate to the difference between a lowly ST and a Falcon, which
is obviously a much better machine than the ST.

Not that I actually made any comments on that subject in any case.

Regards,

Clockmeister.

1) it's spelled "expectations". With such atrocious spelling, TiFKAS
could never be hired an an "Apple Power Rep".

2) Doing well in Germany, huh? Ironically, just a few hours after
TiFKAS posted his drivel came this report from a respected German news
site that paints a much more Steve Jobs Reality-Distortion Field (tm)
free picture:

http://www.heise.de/newsticker/data/se-19.01.00-000/

> Apple feuert deutsche Marketing-Abteilung
>
> Apple Europa hat die gesamte Marketing-Abteilung der deutschen
> Niederlassung in Feldkirchen bei M�nchen entlassen, wie c't aus
> Insider-Kreisen erfuhr. In Zukunft will der kalifornische Hersteller das
> Marketing europaweit vom Firmensitz in Paris aus organisieren. Die
> �brigen Abteilungen der deutschen Niederlassung bleiben den Informationen
> zufolge erhalten. Die Nachfrage der c't-Redaktion beantwortete Georg
> Albrecht von der Presseabteilung in Feldkirchen nur lapidar mit: "Kein
> Kommentar.

In English (courtesy Babelfish):

"Apple Europe has dismissed the entire marketing department of the
German arm in Munich, according to an inside source. In the future the
California manufacturer wants to organize marketing European-wide from
the company headquarters in Paris. The remaining departments of the
German address are preserved according to to the information. Queries by
Insider to George Albrecht Apple's press department were met with the
reply: " no comment. "

the way business works, if you aren't doing too hot in the business,
you get rid of the deadwood. Seems Apple Germany's marketing department
couldn't organize a piss-up in one of their fine breweries, so they had
to go. If they really were selling lots of iMacs, they'd still have
their jobs.

TiFKAS is either being entirely dishonest about how well Apple is
doing in Germany, or more likely in his attempts to pretend being an

"Apple Power Rep", got the story from a website and began making up things out of whole cloth.

Apple has been taking a lot of heat in Europe as of late, especially after their controversial decision to pull out of a major Apple show being held in April in London.

We fully expect to see TiFKAS go into major damage control mode on this one, complete with supposedly witty ripostes against his imaginary friend "Chunks".

3) Sales going well in Canada? Think Different.

About two weeks after TiFKAS posted an article from an Apple club claiming that you couldn't find ANY Apple product in Canada, stores were being flooded with Rev D 333mHZ iMacs - first just in green, then in all five fruit flavours. Even at this late date, Computer City is completely glutted with older iMacs and are trying to blow them out at fire-sale prices.

TiFKAS should also be checking his own back yard, 'cause according to a number of well-respected mail order houses in the US like Small Dog, as well as companies like Price Club, they're also similarly glutted with older iMacs and are likewise blowing them out at fire-sale prices.

Oh, and did I mention the lawsuit that's been launched against Apple Canada by Computer Warehouse, one of their major distributors? Seems Apple is refusing to allow them or other of the Canadian retail stores to sell the iMac online on their web sites, instead giving all Canada selling rights to MacWarehouse - which may explain why Apple hasn't launched a Canadian version of Apple Store despite their many promises to do so Real Soon Now (two years and counting).

4) Milan? You mean the Milan II, which recently got a huge boost when Hewlett-Packard officially announced that they will be providing full support for all their new USB products for Milan II. You know HP, don't you, TiFKAS - the company that recently DROPPED all scanner support for Apple products.

But then, we all know about TiFKAS' axe to grind against Milan, especially after he announced (before the original Milan was released!) that "90% of all Atari applications fall over on the Milan", and was proven horribly wrong. Or his chicken-littling FUD claiming that Milans were all horribly buggy hardware wise, when it turned out it was just a minority of earlier machines that Milan GmBH quickly replaced. Or his championing the GateWay Amiga as a "Milan-crusher", only to have the vapour from that sorry project blow up in his face?

What do you say to that, Mr. "I never called Steve Jobs an arrogant bonehead who would destroy Apple if he ever came back"?

5) it appears that TiFKAS has now given up on DejaNews and is now (shock, horror!) using an ACTUAL NEWSREADER to post from. So much for

his constant crowing "portals are the future, newsreaders are obsolete". Which is doubly embarassing for him seeing as the new version of MT Newswatcher has been getting rave reviews from the denizens of comp.sys.mac.advocacy, you know, the place TiFKAS is afraid to go to because he'd be quickly unmasked as the all-talk know-nothing we all know him to be? BTW, TiFKAS, who set up your newsreader for you - someone at your company who felt sorry for the janitor?

I'll wait for you to get your head out from "Up There" before you reply. :)

Or it could mean is that they want to have marketing consistancy
worldwide. I believe the same thing happened to the UK dept as well.
Apple UK has done well. My mother mailed the iMac insert from Germany.

The adv insert was the same as the U.S. version with minor
modification. Apple's unit sales in Europe were up 50% in Q1.

> TiFKAS is either being entirely dishonest about how well Apple is
> doing in Germany, or more likely in his attempts to pretend being an
> "Apple Power Rep", got the story from a website and began making up
> things out of whole cloth.

Apple sales are up in Germany. Apple Worldwide could only deliver 70%
of the German product backorder in Q1.

> Apple has been taking a lot of heat in Europe as of late, especially
> after their controversial decision to pull out of a major Apple show
> being held in April in London.

Yep. The Paris show is bigger and a better return on investment.
Their call.

> We fully expect to see TiFKAS go into major damage control mode on
> this one, complete with supposedly witty ripostes against his imaginary
> friend "Chunks".

No need to..

Happens when a new replacement line comes on board. Demand falls off
on the remaining end of line(EOL) models. Apple must not have offered
price protection immediately. The remaining stocks are low since Apple
currently keeps low stocks in the channel.

> TiFKAS should also be checking his own back yard, 'cause according to

>
Glutted? Whats a fire-sale price? $899 is not enough. Should read
Robert Morgan's recon article about the likes of Cosco, Sam's Club and
Price Club. What he calls Apple's safety valve..

> Oh, and did I mention the lawsuit that's been launched against Apple

So what does that have to do with Apple's blow out Q1?

> 4) Milan? You mean the Milan II, which recently got a huge boost when

So when will the Milan II reach the shores of Boston Harbor?

Hate to burst the bubble here. HP did an out face a few days ago when
they announced that they made a mistake of leaving the Mac scanner
market and will re-enter the market by March. He he he...

> But then, we all know about TiFKAS' axe to grind against Milan,

The Milan is vapor! Can you buy one at the Boston Harbor? The Amiga
lives on at Amino..Still think the BEOS is the off spring to replace.

But with Mac X with Aqua...who cares...

> What do you say to that, Mr. "I never called Steve Jobs an arrogant

> Their call.

bad call. they've managed to totally cheese off many British Mac
users, and it's going to come back to haunt them. This according to
MacFormat.

>
> > We fully expect to see TiFKAS go into major damage control mode on
> > this one, complete with supposedly witty ripostes against his imaginary
> > friend "Chunks".
>

uh-uh, TiFKAS. You made a claim that they were ALL SOLD OUT. TWO
WEEKS LATER, a glut of iMacs arrived that they're having trouble
dumping. Methinks Mr. Jobs is using the stores for warehousing space...

>
> > TiFKAS should also be checking his own back yard, 'cause according

at $899, it's still too much for out-of-date technology.

>
> > Oh, and did I mention the lawsuit that's been launched against Apple

>

> So when will the Milan II reach the shores of Boston Harbor?

pretty soon, TiFKAS. Just be patient.

>
> Hate to burst the bubble here. HP did an out face a few days ago when
> they announced that they made a mistake of leaving the Mac scanner
> market and will re-enter the market by March. He he he...

that was nice going. But HP's also supporting Milan right out of the
box. Seems they have just as much confidence in an "obsolete" system as
they do with the toy iMacs...

>
> > But then, we all know about TiFKAS' axe to grind against Milan,

> > vapour from that sorry project blow up in his face?
>
> The Milan is vapor! Can you buy one at the Boston Harbor?

can you buy a G4 500mHZ tower ANYWHERE in the world right now,
TiFKAS? Howzabout Half-Life for the Mac. Seems Stevie's been breaking
out in rash promises again..

which Milan, TiFKAS? Milan 040 has been out since August '98. Milan
060 came out about six months later. Milan II was shown at a German
Atari show with reps from Motorola and HP talking about construction and
peripheral support. Right now the schedule for release appears to be on
time. We have at least two members who have expressed interest in the
new machine, and when they get them and show them at a TAF meeting
(which I personally will ensure gets promoted), you'll see a lot more
sold.

The only vapour you should be concerned about emanates from your
hind-quarters anytime you have a thought....

The Amiga
> lives on at Amino..Still think the BEOS is the off spring to replace.

BeOS is also in trouble. Amiga has had many lives, but so far has
failed to produce one scrap of hardware, while Atari hardware has
proliferated.

>
> But with Mac X with Aqua...who cares...

which, according to TiFKAS' yardstick, is also vapour.....

>
> > What do you say to that, Mr. "I never called Steve Jobs an arrogant
> > bonehead who would destroy Apple if he ever came back"?
>
> i thought we resolved this...

sure we did. You lied when you claimed that you never called Steve Jobs an "arrogant bonehead" who would "destroy Apple if he ever came back". When I went through DejaNews and found the EXACT POSTING that contained your foot-in-mouth disease, you conveniently ran away like the coward you are.

Ready to start doing some serious boot-licking to Mr. Jobs? Be careful, he may have been walking through a cow field :)

Hey.

Last I heard, Nolan tried to buy Atari from the Tramiels. But they wanted the JTS deal for obvious reasons. It was smart business, but a real no-risk taker. Had it worked...

nuts.

At the time..the stock was about sold out and eventually replenished..
When a new line comes along will cause sales of the out going line to
slow. Have you ever been part of a product launch and life cycle?
Having a sense when something new comes down the road soon and use the
remaining time to attempt to clear out the existing line. Pretty
Exhilerating and challenging if you ask me..

> >

Actually a shopper mentioned today that the Sam's Club had them at
$700. Even I am tempted. But drawn to the current iMac 350 for the
price. I'd rather have a G4 but can't justify the cost for what I will
be usin it for.

again, what's 50% of squat? Apple traditionally does very poorly in
Europe.

Real numbers, please.

> > > Apple sales are up in Germany. Apple Worldwide could only deliver

uh-uh TiFKAS. Judging from what I've read in the Register, they're
quite mad. And when people get mad, they tend to have long memories
about who screwed them over. Not just users, but also all those people
who spent time and money to set up what was expected to be a
well-attanded show before Apple wimped out.

I have a perfectly round head just like anyone. Why not get that into
your pin of a head?

again, you're noy getting it. You come in here crowing that Apple is
selling iMacs faster than they can make them - "fying off the shelves"
-and yet I'm seeing the opposite, where even in your back yard they're
rotting on mail-order shelves.

> >
> > at $899, it's still too much for out-of-date technology.

better, but still too much. Try $500 CDN and I think we'll have a
deal :)

BTW, it's spelled "using" or "usin'".

.

up to what? Again, you keep crowing about how well Apple is doing,
and yet you're afraid to post real numbers. Or are the numbers as fake
as your claims that you're an "Apple Power Rep", to which you're too

chicken to produce any real evidence?

I'm going to ask David Rosen in a few weeks at ComputerFest (an
honest Apple writer) about what's going on. I can trust David, he makes
sure the rose-coloured glasses stay off....

Milan II is on time and on schedule. April 2000 is the slated date.
And, word is that if they meet their projected sales target, the next
batch may well be PowerPC.

Again, TiFKAS reveals his waster mentality - as well as once again
putting his foot in his mouth, because everytime he slams 68K STs, he
equally calls 68K Macs "junk". And again he writes up his own history of
things.....

>
> No you can get a G4/450...Is that the best you can do?

trying to weasel out of a bad situation, TiFKAS? Steve Jobs promised a 500mHZ G4 by November. November has come and gone, and January (the next projected date) is almost over. Motorola is ticked off with Jobs' insinuating it was their fault for not producing a chip that was vapour when Steve announced it. And to make it even worse, Apple then tried to charge the same amount for a 450 as much as the 500mHZ. Never mind that they had to back off, Apple tried to get away with murder. Remember what I said about long memories?

Until Apple produces the 500mHZ G4 Tower that many people want, I'd suggest you keep your trap shut about vapourware as an argument.

BTW, when's Pharoah coming out for the Mac? :)

>
> So where can one purchase a Milan 040-060 in the states?

where can one purchase a 500mHZ G4 Tower anywhere?

> > BeOS is also in trouble. Amiga has had many lives, but so far has

> > proliferated.
>
> BEOS will be free which can only help. i wonder if Mac X was the
> factor along with Linux?

how can vapour be a deciding factor? Linux yes, but the $999 Mac OSX Server? Client is still vapour, according to TiFKAS' yardstick - it's three years and counting, right?

> this..

yes, I know your approach. It's called lying about it. It's also called ass-kissing when things blow in the other direction, you two-faced brown-nosing hypocrite. When Jobs was out, you insulted him. The minute he got back in, out came the tongue to be applied to shoe leather. Even when he sold out to Micro$oft, you were praising him to the skies. Now that it turns out Billy Boy threatened to crush him like

a bug if IE4 wasn't made top browser on the Mac, do you feel any
different about it?

TiFKAS obviously bases his own career around that of Waylon Smithers,
from you-know-what-TV-show that he's jealous of the creator's success
that he's has to constantly attack it....

I understand, though, that in real life Jobs doesn't really like
toadies...
>

Yep, digging dotches certainly keeps you occupied. But not long
enough to lick Stevie's boots.

I've got a bet going with a friend of mine. Can anyone in this news group tell me the real definition of the word, Atari? Any source for your definition would be greatly appreciated.

4780. Apple Europe (and TiFKAS) going down in flames

Newsgroup: comp.sys.atari.advocacy
Date: 2000-01-27 00:00:00 UTC
From: "Daniel L. Dreibelbis" <dreibel@idirect.com>
Message-ID: <dreibel-F181A4.12114427012000@bigmomma.idirect.com>
Source record: 2345

Despite his swearing up and down that the recent Q1 results show that Apple has made significant inroads into Europe, all sorts of new evidence has proven that once again the Steve Jobs Reality-Distortion Field(tm) has blown up in The iDiot Forever Known As Sinclap's face....

Taken from the well-respected Apple news site As The Apple Turns:

http://www.infoXczar.com/atat

"So Long, Farewell"

"Or, at least, all's right with Cupertino. Sometimes it's easy to forget that Apple's a global company, and its operations don't cease at the U.S. borders.

And the vibe we've been getting from Apple Europe, for example, seems strangely reminiscent of the Scary Times here in the States. The U.K. Apple Expo was canceled (again), the entire U.K. marketing staff was laid off last month, the German marketing staff was pared down significantly, and most recently we heard that all U.K. support staff are being laid off or relocated to Cork, Ireland. Despite reports of Apple Europe's explosive sales growth, we can't help but be reminded of the bloodshed and carnage that ravaged Cupertino a few short years ago.

So when we read in Macworld UK that Diego Piacentini, Apple Europe's general manager and veep of sales, is resigning, we can't help but wonder just how far the shakeup will take things. Okay, Diego has supposedly left Apple "for his own, personal reasons," but in the light of all the layoffs and disruptions in his neck of the woods recently, we find ourselves wondering if his personal reason is simply that "things at Apple Europe suck right now." It's purely speculation, of course, but layoffs and resignations often go hand in hand. Luckily, Diego has agreed to stick around through the end of the quarter while Apple looks for a replacement. Here's hoping that once the dust settles, Apple Europe will enjoy a Golden Age like the one in Cupertino."

So who do we believe? A well-respected web site like ATAT who knows where the bones are buried, or a notorious all-talk, know-nothing like TiFKAS who won't produce any sort of evidence regarding sales figures other than "sales are up 50%!" (again, what's 50% of SQUAT, TiFKAS?), not to mention any evidence that he is employed by anyone connected with Apple other than providing links to sites that nowhere mention his name?

I thought so. :)

Once again, we expect to see TiFKAS go into major damage control on this - as well as on the news that Apple's DVD iMacs and their G4s . have serious flaws that prevent it from properly playing back video output, as recently reported in reviews in MacWorld and admitted by Apple themselves on their web site.

Of course, as he's still seeing "Chunks", his imaginary friend who doesn't exist, we doubt that we'll be getting a coherent answer from him - getting proper facts from TiFKAS is like trying to nail Jell-O to the wall.

"And the fake Apple Power Rep can be identified by his high-top sneakers and foul mouth"

Jobs did not promise a 500mhz by November. Were is the press release on
this or is it delusion?

Also, they downgraded the clock speed by 50mhz on each configuration
but everything else is the same..

Also, later G4/350 buyers got the sawtooth motherboard and DVD for the
same price..not bad..

> Until Apple produces the 500mHZ G4 Tower that many people want, I'd
> suggest you keep your trap shut about vapourware as an argument.

They cancelled the model and have not said anything more about it.
Thats not vapor. Vapor is when firms promise and promise and not
deliver.

While I am writing this, CNN has been bombarded with the latest new
iMac commercials. very well done. A company advertising in Q2 like
this is unheard. Looks like Apple is expecting another blow out in Q2.

> BTW, when's Pharoah coming out for the Mac? :)

Nope. Mac gaming users did not want it..But thats were VPC come
through.

> >

Lets get this straight. First off, I thought deja all over again.
Many thought so to. I guess over a decade in exile changed his ways
and became matured in the role.

Microsoft bought $150 million in Apple's preferred shares. You will
see it on the financial consolidated sheets. Apple had plenty of cash
at the time. MS investment was directed toward the street when Apple's
credibility was an all time low.

> TiFKAS obviously bases his own career around that of Waylon Smithers,
> from you-know-what-TV-show that he's jealous of the creator's success

> this or is it delusion?

he certainly did - does THIS jog your selective memory?

http://www.lowendmac.com/musings/g4-500.shtml

Where's the G4/500?

21 January 2000 Dan Knight

Remember how Steve Jobs announced the Power Mac G4 on August 31,
1999? Therewould be a less-expensive 400 MHz model plus two faster
machines with AGP video and more. The "Sawtooth" models would run at 450
and 500 MHz.
^^^^^^^

Due to production problems at Motorola, the G4/500 was postponed until
January 2000.

Then, on October 13, Apple dropped the base G4 to 350 MHz and offered
the"Sawtooth" version in 400 and 450 MHz variants.

At the start of December, Apple quietly replaced the "Yikes!" G4/350
with a "Sawtooth" model at the same price.

Where's the Beef?

It's late January. Macworld Expo has come and gone without a single
Applehardware announcment. No "Pismo" PowerBook. No faster iMac. No
iBook with adequate memory.

And no Power Mac G4/500.

> > Until Apple produces the 500mHZ G4 Tower that many people want, I'd
> > suggest you keep your trap shut about vapourware as an argument.
>
> They cancelled the model and have not said anything more about it.

which is what they did with the G4 500mHZ.

> > BTW, when's Pharoah coming out for the Mac? :)
>

> Nope. Mac gaming users did not want it..But thats were VPC come
> through.

lots of Mac users did want it. And it's being considered as another
black eye to the Mac gaming community.

May we also add the decision to cancel Pharoah by the developer had
to do with the fact that Caeser III, also done by the same company,
tanked as a Mac game?

Sounds like sour grapes....
>
> > >
> > > So where can one purchase a Milan 040-060 in the states?

but it ain't OSX Client, which is a complete replacement; unlike the
OS upgrades, which basically adds chrome wheels and stripes to a Yugo.

>
> Lets get this straight. First off, I thought deja all over again.
> Many thought so to. I guess over a decade in exile changed his ways
> and became matured in the role.

it's spelled "too".

judging from his performance from a non Reality-Distortion Field (tm)
stance, Steve hasn't grown up. Witness the hissy fit at Macworld Japan,
breaking out in rash promises regarding Macs whose processors haven't
been developed yet, and reports from mac.advocacy that Steve has once
again turned the Cupertino offices into an armed camp with employees
fearful for their jobs. Yep, it's deja vu all over again....
>
> Microsoft bought $150 million in Apple's preferred shares. You will

The word Atari comes from the Japanese game of Go. It is similar to the term check that is usually in chess. Originally when Nolan Bushnell incorporated the game back in 1972, he originally wanted to use the term synergy for his new company. He found that the name had already been used by another company, so he used the term Atari since he was an avid Go player.

You can find out more about the history of Atari by visiting Curt Vandel's Atari Historical Socieity by visiting the following link:

The question was posed on a recent "Who Wants to be a Millionaire?" (a popular American quiz show). Four choices for what company name translates to "prepare to be attacked". The contestant guessed Atari and got it right.

Unrelated, and off-topic like the original question, does anyone know how Wayne Gretzky is affiliated with Atari? A recent magazine article listed "Atari" as one of his many endorsements. Is there a video game that uses his likeness?

Nobody here is disputing that, I think.
That doesn't make those platform useless, though.

> Windows and Mac PC's are far more functional then anything
> Atari and Amiga could hope to offer at this point in time.

I really hate Window's guts; it makes my everyday job a pain:
Word contantly trashes its own dictionary, Netscape stops to
repond to mouse clicks after too much browsing, etc. etc.

MacOS X is something really marvellous, however. Too bad Macs
are so damn costly outside USA. Apple's loss, really. No wonder
they are not profitable in Europe, as they overprice everything.

Because of this, I'm going the BeOS way, on Mac/PPC hardware. It
keeps the pleasant, user-friendly aspects of Atari and Amiga but
also boasts a rather good kernel under the hood.

This doesn't mean my TT is gathering dust, quite the contrary.
Right now, it acts as my appartment's gateway and fileserver and
remains highly usefull for web authoring on CAB with Everest.

Somehow, despite all the novelties and increased speed, those new
beasts often go the long way, to perform things the TT can do in
seconds using very simple and straightforward applications.

Really?. My posts generated threads, as intended. If it wasn't for Sinclap
or odd posting by me, this group would be dead.

It is an advocacy group is it not?. Perhaps there isn't much left to
advocate on the Atari front.

Too bad, I'm going now. Reality suggests that both the Atari and Amiga are
no longer viable platforms except as hobby/hack interests.
No amount of BS can take away from the fact that Windows and Mac PC's are
far more functional then anything Atari and Amiga could hope to offer at
this point in time.

Thanks to all who I have had intelligent conversation/lighthearted fun with
in this group (esp Darkchyld).

CYA

Regards,

Clockmeister.

Like your computer.
Sinclap doesn't have a job. So he needs something to do.

>It is an advocacy group is it not?. Perhaps there isn't much left to
>advocate on the Atari front.

Where does it say advocacy? I don't know what you are talking about!
Oh, yes. It does say advocacy.
There is lots to advocate on the Atari. But none of it can be found in Dans post. Simply better written in Mac Advocacy.
Maybe you are right, Maybe their isn't anything to advocate Atari.

>Too bad, I'm going now. Reality suggests that both the Atari and Amiga are
>no longer viable platforms except as hobby/hack interests.

Hobby/Hack interest is viable for the hobbiest and hack. I will be hobbying my way to a Milan. Cool enough for me. However, I want something more powerful. But the Milan will do should it set sail this side of the ocean.

>No amount of BS can take away from the fact that Windows and Mac PC's are
>far more functional

And boring. The biggest problem is that they are neither an Amiga nor an Atari. And the users as a mass are not nearly as friendly as the smaller 68000 based community.

Besides their are still many things an ST/Atari computer does better than a PC. Unfortuneately its not the internet.

I don't know if reformating or repartitioning a PC hard drive is really providing more functionality:-). My buddies seem to have to do it alot.

> then anything Atari and Amiga could hope to offer at
>this point in time.

Hmm? Is it easier to program in Windows or for the Atari ST?
Give an Atari Computer more Horsepower, simple get it back to current standards and it will be far more functional than an equivalent PC.

However, I tend to compare functionality based on the time of the computers purchase. My ST provides more functionality than any computer purchased during the same period. This is why I still use it to this day.

>Thanks to all who I have had intelligent conversation/lighthearted fun with
>in this group (esp Darkchyld).

Good Riddence. You were a Pest and I never like you!. And Darkchyld. What a silly way to spell. He won't be able to read your farewell post, because.

1) He can't read.
2) He no longer has Atari Computers. (Well one, but that isn't enough anymore). So now with his PC he is unable receive this NG.

>Nobody. The same goes about Clockmeister and his Amigas.

At least Clockmeister doesn't advocate "to discontinued support of the ST".

You are far more an evil force then him. You want to kill the ST, while everyday someone shows up in comp.sys.atari.st with one. Or is looking for one. Or has one they recently aquired and want to learn about it.
STill too many STs in use or put back into service, than to bother ignoring, or abandoning. They are just too useful. And with new mods coming from Europe, their is still plenty life in an ST.

Apple Europe post is irrellavent. Who cares? Post the reply in Mac Adv and make them made or upset. It has no effect on me what happens.

Now correct me if I am wrong, and since, he has abandoned us. In a pathetic retreat only worthy of an Amiga User, the Clockmeister does have a 1040STDS. And if he doesn't he should. Only to hack and play with. As like his other 68000 toy, it is a great hobby computer and hack machine.

I don't mind comparing Amigas and Ataris. Its fun. I don't mind Comparing Amigas, Macs, PCs to Ataris. THis is advocacy and thats what its for. But simply posting about Macs sales in Europe and whether they are accurate or not is truly meaningless to an Atari User.

Like I said, who cares?

There was an few good thread here recently without TIFKAS that involved, Iggy, Clock, yourself, and me, some Curmudgeon and other ST users.
Followed by a thread by an Amiga Using, Atari TT purchasing Newcomer.

Good advocating, that went all around. Could have went further, but I think I either encountered a NEWsie problem, or a NEWSERVER problem. I think the NEWSERVERS have encountered some troubles recently. (As many users have lost posts and replys and threads, infact sometimes it seems whole feeds have disapeared for a few days. I have gotten some posts from NGs 12 hours before my Neighbour did with his PC and a different server. I wondered why he didn't reply to a very rude counter attack, and he simply hadn't gotten the evil post yet. But he did get the other posts. Sure enough the one did arrive later. Very strange.)
Back on topic. I don't mind a thread that attacks atari, or compares it when in Advocacy. NAH, NAHs, and all. But Simply a post about Apple Computer is just a waste of bandwidth.

And why did Dan stop using Deja, at the same time that Sinclap did? Did you both figure out how to use a newsreader on your Macs at the same time?

Speaking of Macs, at least we can get close to what one is good for. And that is creating a fast Atari.

Heres some questions for Dan. (Ponder these as I will ask them again in about 3 weeks.

1) What does noSTalgia emulate? An ST or can it run TT Falcon software?
2) What speeds does it attain?
3) How Stable is it?
4) What is the Minimum spec of computer required?
5) Does it play games?
6) Do you get all resolutions from a single monitor?
7) Can it play demos?
8) If the midi ports work as you claim. How does one run Notator?
9) Does all midi software run?
10) Does Multitasking Midi software work? STeinburg etc.

What advantage does it have over Magic Mac?

Can you get STing/Iconnect or MINTNET running in NoSTalgia?

How fast is printing? Is it faster than the Mac printing, or slower than an Atari Printing?

Have you networked your Falcon to you PPC?

Questions for QFunk.

Now, Recently I went to your TT page. Unless I went the wrong way, things still appear under construction. Whats up? Do I have to get you that ST to get the job done? It getting to the point where i just might Send you my 1040STe.

Will the Mint Distribution Kit ever see the light of day?

Later Brian.

Yes, still doing the 68k, but using Coldfire hardware that will run
at 400MHz by the end of 2000 according to Motorola...

The frugal resource drain inherent in Atari OS and software will mean
that a 400MHz Coldfire CPU will provide an extremely fast computer at
a price equivalent to low-end PC's.

Also, if Milan II sales targets are met then development on Milan may
shift toward PPC core chips like the G4/MPC units. Its always quite
satisfying the way my Falcon boots to a useable desktop in ten seconds
from cold, unlike all/most Macs. I'd LOVE to see how quickly a MagiC
Milan machine would boot...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Truth be told there is much of it in this text, but still Amiga and Atari
chug away against the evils of M$ (and Apple?). I'm always impressed that
people can have the freedom of choice to lean away from the choice of the
multitude masses, who have bought PC's because they know no better...

> and 500 MHz. ^^^^^^^

Yes..Due to supply issues with the 500mhz G4 chip, they had to revise
the product line..Whats your point?
>
> Due to production problems at Motorola, the G4/500 was postponed until

Cleaning house and being eficient is bad? Apple has implement global marketing/sales strategy that is consistent from country to the next. So who needs duplication?

Designed to increase web traffic=banner revenue. I spent time with the
honest web site operators at MacWorld who deride the tabloide type
journalism.. Even Rodney O in his latest columns deride this..

Web sites are not known to get the facts properly. Rumor web sites
come to mind? Mr. Piacentini, a 13 year Apple veteran got a job offer
he could not refuse from Amazon.com. People make job changes. I would
if I spent 13 years with a company.

> I thought so. :)

The way it works, the icon's styling, etc. remind me of AmigaOS
or MiNT+NAES+Thing: Unix stuff under the hood, with a pleasant
and easy-to-use GUI on top.

> >This doesn't mean my TT is gathering dust, quite the contrary.

>
> Hmmm? With an Ethernet adapter for the ST, couldn't it do
> exactly the same thing you TT is doing?

Maurits Van De Kamp is using an old Bionet adapter on his ST's
ACSI port to connect his whole rig: TT, Falcon and a Linux box.

However, given the overal slow hardware speed, I'm wondering how
much heardroom an ST has. I certainly wouldn't use it as gateway
for a whole family house, for instance, but a TT can handle this
without any problem.

> >Somehow, despite all the novelties and increased speed, those new
> >beasts often go the long way, to perform things the TT can do in
> >seconds using very simple and straightforward applications.
>
> Such as? I have no Idea, as you are speaking of things I am
> unfamiliar with.

Take GEMs like Everest and Qed. They use almost no ram, work hand in hand with OLGA to have other apps automatically reload a text when it is saved, and have some really neat text formatting options that can all be accessed using keyboad shortcuts.

They can also both use kurzels, which makes it a breeze to write in C or HTML by using a few keystrokes which are auto-expanded to full source code, so you can write a whole text in a few minutes.

Or think about ImageCopy and GemView. They handle pretty much any image format, can thin down the amount of colours used in an image or change the file format in a couple of mouse clicks, etc.

The only other application I have seen that is as immediate as ImageCopy is GIMP, on Unices. Nothing on Mac/Windows is that easy nor complete, especially not Paintshop Pro.

On the hardware side, the TT has 5 serial ports plus ACSI, SCSI, VME and Centronics; you can basically connect anything to it.

This means, you can easily handle a multi-user BBS with it, as you can connect 4 modems simultaneously (although both Serial1 and Serial2 lack the ring detect signal).

Since one of the ports is RS422, you can connect straight into an old Mac's serial ports with a null-modem cable (n.b: mac printer cables are the same) and share files with it.

Note: please stop calling this an "AppleTalk" port. AppleTalk was a networking protocol, not a physical connector.

If you have one of Atari's laser printers, the TT was the last machine manufactured with an ACSI port, so you can still use it.

Note: the Falcon does not have any ACSI port.

For extra peripherals, there is a standard 25-pin SCSI port.

Sure, some will argue that IDE is cheaper and it's all you really need. Then again, ask my dayjob's BOFH what kind of drives are in our new fileserver beast: SCSI, not IDE.

***

I have seen some Amigas which were nearly as fun, especially on the graphics software side of things. Amiga software is usually graphically pleasant to use and highly creative, especially for graphics and animation stuff.

Music really has always been an Atari kingdom for ages, though. Built-in MIDI ports pretty much oriented Atari sales for a whole decade: music stores was where most sales happened.

Hardware-wise, the TT is hard to beat, except for its admitedly limited screen colour/size ratio. Several developpers released VME graphic cards to compensate for this, though.

So, there you go. Clock asked, Brian motivated and I answered.

> one.

Sorry? I specifically started this "What's an ST good for?"
thread to show people that it in fact _is_ still usefull, but
people should still be aware of its limitations.

An ST with TOS 2.06, an internal drive and 4 MB of ram is a real
charm to work with, for DTP or MIDI, which is where it still
shines the best. I love my Stacy for that.

However, running Apache or an AES with _many_ applications in the
background is just too much for an ST. On a TT, this is still
fast enough to be usable.

> Questions for QFunk.
>
> Now, Recently I went to your TT page. Unless I went the wrong
> way, things still appear under construction. Whats up?

Rather busy with my dayjob. It leaves me with very little spare
time, as I said in my welcome statement.

However, the old version of the page is still there.

> Will the New Mint Distribution ever see the light of day?

If a stable library ever sees the light of day, sure. Right now,
the MINTLIB is in a rather messed up state which prevents me from
successfully recompiling existing tools.

It has evolved a lot, I really praise Guido Flohr's work on it,
but it is currently in an in-between state where it is useless:
too far from the old libraries to compile previously available
packages, but not close enough to the full Posix thing to compile
most of the GNU/Opensource/freeware straight out of the box yet,
either. So, basically, I'm waiting for that new MINTLIB.

Not when TiFKAS is spreading his normal anti-Atari FUD. Someone has to play devil's advocate against him :)

> And why did Dan stop using Deja, at the same time that Sinclap did?
> Did you both figure out how to use a newsreader on your Macs at the same
> time?

actually, I've never used Deja to post, unless I was at a computer trade show and was doing so from an internet booth to let certain newsgroups know what I've found. At home, I alternate between NEWSie (when on the Falcon) and MT-Newswatcher (currently at version 3, and quite good) when on the Mac. And when I use Deja at home, it's usually to search out past posts of TiFKAS' to show him where he's been trying to rewrite his own posting history.

I find it highly amusing that TiFKAS goes on and on about the "Newsreader is dead, long live portals!" claptrap of his as an excuse to cover up that he hasn't the brains to blow his nose, let alone set up a real newsreader. A lot of Mac users also disagree with him, MT Newswatcher 3 was getting rave reviews when it came out about a month ago.

> Speaking of Macs, at least we can get close to what one is good for. And
> that is creating a fast Atari.
>
> Heres some questions for Dan. (Ponder these as I will ask them again in
> about 3 weeks.
>
> 1) What does noSTalgia emulate? An ST or can it run TT Falcon software?

generally an ST up to TOS 2.06, although to my surprise and amusement it'll also run MagiC 5.

> 2) What speeds does it attain?

haven't done a benchmark on it yet (I should!) but it appears to run at standard ST speeds.

> 3) How Stable is it?

it appears to be pretty stable at running utilities, and MagiC is
like a rock running under it. Games depend on the type of game it is,
they include a copy of Revenge Of The Mutant Camels that runs OK, I've
tried running Populous II (my own copy) and it tends to crash.

> 4) What is the Minimum spec of computer required?

a fairly fast PowerPC machine, runs OK under a 180mHZ 603e machine,
but does better under a 604 or a G3 according to the Atari Computing
review.

> 5) Does it play games?

it does but not all games. Under Populous II it gets cranky under
mouse control and tends to crash. Haven't tried very many games on it as
of yet. I suspect that some games, due to the fact that they were
written to access certain hardware directly, would crash.

> 6) Do you get all resolutions from a single monitor?

yes. You can also call it up either in a small window or do a full
screen in the monitor. There's also a 640x400 16-color mode available,
but only with TOSes above 1.4.

> 7) Can it play demos?

I've heard it does, haven't tried it yet.

> 8) If the midi ports work as you claim. How does one run Notator?

you can't. Due to the fact that Notator uses a cartridge port dongle
as copy protection. Same with Cubase. Haven't had a chance to play with
the MIDI stuff yet, but I'm going to try MIDIMan. BTW, it's supposed to
work with the Quicktime Instruments so if you don't have access to a
MIDI instrument you can at least have some fun.

> 9) Does all midi software run?

going to try that out. Especially the Electronic Cow stuff.

> 10) Does Multitasking Midi software work? STeinburg etc.

again, haven't tried that.
>
> What advantage does it have over Magic Mac?

obviously the ability to play games as well as accessing the low res
modes.

>
> Can you get STing/Iconnect or MINTNET running in NoSTalgia?

not yet, the writer is hoping to implement accessing the serial ports
in a future release.

>
> How fast is printing? Is it faster than the Mac printing, or slower than

> an Atari Printing?

can't print directly, since it doesn't access the printer ports. It
can save printer output as a file. This is where MagiCMac shines,
especially in combo with NVDI 5

>
> Have you networked your Falcon to you PPC?

planning to.

Yep. Saying they're "Flying off the shelves" and "unavailable and
back-ordered", then backing off when the real truth comes out, is called
backing off.

Why didn't you use that excuse after the Daily Tubby blunder?

> > no, pragmatic. I like getting bang for my buck, and not going

SPAM is also posting unrelated topics in newsgroups where it don't

which got you a reprimand from cedarnet.org....

> > I asked for the specific Canadian results, weinerhead. Don't weasel

> Yes..Due to supply issues with the 500mhz G4 chip, they had to revise
> the product line..Whats your point?

a 500 mHZ G4 was promised for delivery. It was never delivered. It turns out that a 500mHZ G4 didn't even exist when Jobs promised it, and when it was discovered that Motorola couldn't produce one due to crippling problems, it remained vapour. What part of that don't you understand?

Please note that he also gave the exact date when Jobs announced the 500mHZ G4 and when it would be available. I find it hard to believe that such an "Apple Power Rep" would suddenly conveniently come up with amnesia regarding his hero....

> >

>
> Yes...Oh that was the reason for the holdup..Da!

nope. That's the result of Apple forced to use all the G4 chips that couldn't even handle 400mHZ. If you'll remember, Apple wouldn't even consider anything below 400mHZ.

>

he didn't say they were vapour, did he. But the announced but never released 500mHZ G4 qualifies.

>
> > And no Power Mac G4/500.
>
> Probably nver will be..

so you're admitting it's vapour. Fine.

Now SHUT YOUR TRAP when trying to declare the Milan II (which HAS been shown as a prototype, HAS the support of two companies, and HAS the backing of a company with a proven track record) "vapour" because you know you're losing an argument....

>
> Oh sorry charlie..

atari.advocacy wants posts with TASTE, not posts from tasteless
paranoid clowns with no life.....

>
> Apple did not promise...And you know that...Where is the press release
> on this?

can you prove otherwise. Once again, Dan McKnight, who runs
LowEndMac, is a well-respected journalist whose integrity and honesty is
beyond reproach. Wheras TiFKAS, a troll of dubious honesty who leaves a
trail of slime wherever he goes, has been caught with his pants down so
many times he makes Bill Clinton look virginal....

> >
> > lots of Mac users did want it. And it's being considered as another
> > black eye to the Mac gaming community.
>
> We take the lumps..But other titles are around the corner..

yep, and being gouged price-wise. Why can you get TR II for $9.99 for
the PC now when Mac users have to pay through the nose at $69.99 CDN...

> > okay. so shut your trap.
>
> But you can purchase the G4/450 one...

but not the promised G4/500mHZ model, which qualifies as vapour.
Again, shut your trap.

> > > licking boots from experience..Must be that bonding thing..
> >
> > Ahaa, so you admit it!
>
> No..due to sinclap's punctionality deficit, he left out the question
> mark..asking you...

nope, I don't boot-lick. Never have. Never will.

and look, TiFKAS admits he has a punctuation deficiency, which like his lack of spelling skills, is nothing to make light of. And which proves he's pretending to be an "Apple Power Rep", since the guidelines for what they require in a candidate include superlative language and spelling skills....

Now get back under that desk! Mr. Jobs has an important meeting to go to, and he wants those boots to shine like mirrors!

>
> sinclap
>

oh, yeah, here's something I found on Macintouch (once again, a well-respected Mac site that isn't afraid to pull punches):

http://www.macintouch.com/g4.html

"Jobs finally revealed Apple's new "pro desktop" line, the Power Mac G4 "personal supercomputer," designed to handle image processing, encryption and similar tasks that are "bringing today's personal computers to their knees." Apple's new line, powered by the new PowerPC G4 chip, qualifies as a personal supercomputer by its ability to execute more than one billion floating-point operations per second (a gigaflop). Its "velocity engine" is a 128-bit instruction unit with the ability to execute four or more instructions in one cycle.

" Prices range from $1599 to $3499 for models running at 400, 450 and 500 MHz. (The Apple Store lists a $1499 configuration without modem.) The Power Mac G4 architecture differs between low-end [model M7631] and high-end [M7232, M6921] products. The 400-MHz computer represents the low end and is shipping now (although the Apple Store is quoting 30 days for delivery), while 450- and 500-MHz versions are promised for later,
^^^^^^
in September and October respectively."

please note - this is a news story from a respected news web site which clearly states that Steve Jobs, indeed, promised delivery of a 500mHZ G4 system to consumers on August 31st, 1999 - by OCTOBER, which makes his scheduling announcing of vapourware even worse. Macintouch has no reason to make up a news story of significance to the Mac community. TiFKAS, on the other hand, due to the fact that he has to wipe the egg from his face in his futile attempts to label the Milan II, a computer system that completely ruins his whole world-view that "Atari is Crap", vapourware, has a very good reason for constantly denying that Steve Jobs ever made such a statement, and is willing to be completely deceitful in order to maintain his fantasy world.

Ready to surrender, TiFKAS? Too afraid to admit you made a boo-boo?

Yup - I still use the Mega/STE for Pagestream and a few other things -
altho I am fast becoming a convert to 'Appleworks' which seems to do
most 'business' things that I want to do.

PageStream is my choice of DTP as it does almost everything I want and
is now available in a Mac version - which I will be ordering shortly.

But - yes - I would be interested in the Milan - assuming of course
that the OS is as simple and rock solid as the old Atari OS - and the
price would not cause my nose to bleed !

The Canadian Curmudgeon (in sunny, 5C, Calgary)

well, the Milan II will be shipping with a MagiC/NVDI setup as its
default running operating system (and Pagestream DOES run quite well
under MagiC, from my own experience with it on the Falcon) - but if you
prefer something simpler, you can press a key while it boots up and go
straight into standard Milan TOS.

Just remember, though, that under an '060 system Pagestream will
SCREAM, be sure your chair is bolted to the floor :)

And price? They're still talking sub-$1000. That's also including
what's turning out to be a nice set of pre-packaged software, including
internet setup, utilities including a lite version of Papyrus, graphics
programs and games. Not to mention the ability to plug and play
Hewlett-Packard peripherals via USB.

The good news from the international front is pouring in...

Daily News
Buoyant Apple Plans New Stores
By David Frith, Computer Daily News.
January 28, 2000

Apple Australia [NASDAQ:APPL] hopes to see five or six extra specialist AppleStore retail outlets operating in major Australian cities this year, says Diana Ryall, managing director of the local subsidiary. The Australian subsidiary - which pulled out of mass market outlets several years ago - scored a "phenomenal" increase in sales of its iMac and iBook consumer Macs, especially high-end models, in the Christmas quarter, which saw the opening of a number of new AppleCentre satellite stores, Ryall said. About 60 independently owned AppleCentres operate in major Australian towns and cities. Most are one-brand operations, selling Macintoshes, software, service and support to both the consumer and business sectors Ryall was commenting on the boom first quarter results announced by Apple HQ in Cupertino last week. But, as is customary with Apple under chief executive Steven Jobs, country managers are forbidden to even hint at numbers for local sales. Ryall said the company was "very excited" about sales through another new series of outlets: the OptusWorld retail stores operated by Australia's numbertwo telecommunications carrier, Cable & Wireless Optus. The OptusWorld stores did an excellent job of promoting the iMac and iBook in an innovative setting, said Ryall. She believed Apple Australia was most unlikely ever to return to supermarket-style retail chains, where sales had been indifferent.

how can I, when the "Atari Jihads" only exist in your paranoid little
imagination?

Wanna name some examples? Dates, times, situations?

BTW, that's "Atari Jihads WHO have spelling errors". Syntax is as
important as spelling. The imaginary Jihads in your head ARE people too,
you know :)

people who want to make sure that they're getting the best info want
to make sure they're not getting it from a doofus. This has been brought
up many times in MacAddict.

>

"probably" doesn't cut it.

And that's still pretty good for a small company, 50 computers a
month. Now imagine what's going to happen now that Motorola is behind
the new one. :)

uh-uh, TiFKAS. they're using the same excuses the Tramiels did in
getting out of the UK, and why they've fired the German marketing
department. You can't have it both ways. Somewhere they're bleeding red
ink, and most likely it's in Europe, where they've traditionally had
poor sales.

nope, Coke is LOSING money. Only companies who are losing money fire
longtime employees. Or are you using the same logic you used when you
claimed "Apple made a profit!" when they announced a ONE BILLION DOLLAR

LOSS....

I'd like to see you wiggle out of THIS one....

where is a press release denying that they ever did? Enough reporters
were there to hear Jobs promise a 500mHZ G4 and reported so.

You're just to afraid to admit you were wrong. Admit it.
>
> > >

> execs..And I did not read a memo about it either.

probably because you seem to be selective about reading?

Macintouch also reported that Jobs said so, and when they were to be
released. Macintouch is well-respected at getting things right.

Just because Apple is being tight-lipped about this elephantine
blunder doesn't mean it didn't happen. After all, Nixon denied anything
was going on regarding Watergate.

Below is a note that announced the cancelation of the first G4 models
due to processor supply constraints. The new configured models will
increase supply shipments. Apple put an end of all talk to the G4/500
model due to unavailability of the chip..

Apple Reconfigures Power Mac G4 Processor Speeds to Match
Chip Availability

CUPERTINO, Californiaï¿½Oct. 13, 1999ï¿½Appleï¿½
today announced that it has reconfigured the processor
speeds in its Power Macï¿½ G4 line to match
PowerPC G4 chip availability from Motorola. The new Power
Mac G4 configurations will now include
processors running at 350 MHz, 400 MHz and 450 MHz, and will
be priced at $1,599, $2,499 and $3,499,
respectively. The move is in response to Motorolaï¿½s delays in
reaching volume production of its 500 MHz G4
processor chip, which is now scheduled for availability early
next year.

ï¿½These new configurations will enable us to
meet the tremendous demand for our new Power Mac G4 line,ï¿½
said Steve Jobs, Appleï¿½s interim CEO.
ï¿½Fortunately, the machines remain very, very fastï¿½easily
outperforming Pentium III-based PCs.ï¿½

1) your imaginary friend "Chunks" doesn't exist.

2) thanks for confirming to all that the 500MHz G4, which had been
officially announced and promised by Steve Jobs at Seybold on August
31st, 1999, and had orders taken for it, is officially vapourware.

Admit it - you LOST.

4819. Some thoughts on why we're here...

Newsgroup: comp.sys.atari.advocacy
Date: 2000-02-02 00:00:00 UTC
From: Paul Flieshman <P.L.Flieshman@student.salford.ac.uk>
Message-ID: <389843AD.3717746B@student.salford.ac.uk>
Source record: 2284

Hi there. In light of the recent threads involving Brian and Clock, and the ever - present sinclap / Daniel wars, I felt somewhat compelled to post something up. I use computers for browsing, email/newsgroups, some simple w/p, but primarily for hi end audio and MIDI (sequencing, wave/samlple editing, multitrack audio, signal processing). To me, the computer is a tool for making or manipulating music. Now, just because that tool has been superceded, replaced, or is no longer in production is no good reason to stop using it, or decide that it is no longer useable. I use Protools on the Mac with my production business, and PC's at university and home. But I also have a Falcon 030 and a 4mb Ste....and they are all good. So....here's some mud for your eye;

1) My STE is great for sequencing on location....far more stable in transit, and less of a fragile liability than the Mac or the PC.
2) Tos and multitos have proved to be stable, easy to use, intuitive and user friendly.Windows? You wish. Mac OS? Better, but still flawed.Both are vastly better equipped and bigger, but are they as stable or easy to work with?
3)y Falcon is great for samplers with SCSI, and Cubase Audio Falcon really works....I've spent thre years trying to make my p200mmx system integrate at all.
4) These computers are fun.... and the small industry of people developing new upgrades/machines/software are part of the minority who still enjoy them. What's wrong with that?
5)In terms of speed/power/ram etc etc what is the point in comparisons with a 700mhz athlon or 450mhz g4? Pick on someone your own size, who isn't fifteen years out of hi end development.
6)Atarians....don't waste your time arguing the merits of the milan over the mac. The people who like 68k machines are interested already.
7)This newsgroup is called Atari advocacy....that means finding a reason to still use and enjoy these machines. That doesn't mean "let's try and tell everyone that our machine is the best computer in the world". The doing is the important bit.

Oh and lastly....sinclap....this isn't a mac newsgroup. So don't post loads of stuff about how you thisnk ataris make good paperweights....no one really cares what you think (though we are all impressed at just how long you have been hanging around this NG...nothing better to do?). Besides, if apple are top o' the world, what do you care about a minority machine with only hobby and hack users?

Sorry for the vitriol.....I feel better now.

Lata!

Paul ;-)

P.S. I kinda like the idea of beOS.....looks like the mac front end, powerful and ultramodern, no legacy layers, total hardware integration....anyone actuallly using it yet? Is there a 68k version?

portability has always been great on these machines, and now with things like Mario's internal IDE adaptor, they now can add internal storage to the luggage :)

> 2) Tos and multitos have proved to be stable, easy to use, intuitive and
> user friendly.Windows? You wish. Mac OS? Better, but still flawed.Both
> are vastly better equipped and bigger, but are they as stable or easy to
> work with?

TiFKAS always misses the point on this. For MIDI, TOS is the most rock-stable regarding timing. Why do you think so many musicians still trust using their "obsolete" Ataris for their projects?

MagiC has also proven to be quite stable. How many OSes that you know of that, when a program crashes, you just remove it from memory and just keep going? On my Macs, one crashed program can freeze up the entire computer.

> 4) These computers are fun.... and the small industry of people
> developing new upgrades/machines/software are part of the minority who
> still enjoy them. What's wrong with that?

Nothing at all! Probably TiFKAS is extremely jealous because he has no friends and he wants some attention, so he comes in like the schoolyard bully expecting the disrupting of the happy Atarians at play. Of course, what really happens is that he's Bluto in a schoolyard full of Popeyes who have "eaten their spinach" :)

> 5)In terms of speed/power/ram etc etc what is the point in comparisons
> with a 700mhz athlon or 450mhz g4? Pick on someone your own size, who

who was it who said "no weapon is too big or too small for a brave man?" :)

> 7)This newsgroup is called Atari advocacy....that means finding a reason
> to still use and enjoy these machines. That doesn't mean "let's try and
> tell everyone that our machine is the best computer in the world". The
> doing is the important bit.

but the Atari IS the best computer in the world - in fact, it's
probably the world's best-kept secret. Of course, with the Milan II
coming out, the secret is coming out again :)

>
> Oh and lastly....sinclap....this isn't a mac newsgroup. So don't post

probably this best describes TiFKAS' entire mindset:

"A fanatic is one who redoubles his effort when he has forgotten his
aim" - George Santayana

BTW, this is one of the basis behind Chuck Jones' creation of Wile E.
Coyote, someone TiFKAS is beginning to resemble more and more with each
new post...

>
> Sorry for the vitriol.....I feel better now.

that wasn't bad at all. Maybe you should get angry more often :)

Agreed.

> 1) My STE is great for sequencing on location....far more stable in
> transit, and less of a fragile liability than the Mac or the PC.

I couldn't agree more. An STE with 4 MB, TOS 2.06 and a built-in
IDE drive is the best MIDI sequencing tool, bar none.

> 2) Tos and multitos have proved to be stable, easy to use,
> intuitive and user friendly. Windows? You wish. Mac OS?

> bigger, but are they as stable or easy to work with?

I like the new Macs _a_lot_ but the outrageous price outside
North America makes Mac an unrealistic option for the mass.

As for Windows.... I just cannot shake Microsucks products, not
because they were made in Redmond, but because they constantly
mess up their own configs, especially Office applications.

> I kinda like the idea of BeOS: looks like the mac front end,
> powerful and ultramodern, no legacy layers, total hardware
> integration....anyone actuallly using it yet?

I'm still waiting for my copy of the full CD.

However, my experiences of it, on other people's machine, have
been very good. In fact, good enough to convince me that this
was where I was heading next, as a complement to my TT.

> Is there a 68k version?

No, only Intel or PPC.

> 3) My Falcon is great for samplers with SCSI, and Cubase
> Audio Falcon really works....I've spent thre years trying to
> make my p200mmx system integrate at all.

I've heard the same thing from countless people. They "upgrade"
to Windows version of Cubase Audio or Logic Audio and... nothing.
On Atari, they recall, things worked right out of the box.

> 7) This newsgroup is called Atari advocacy....that means
> finding a reason to still use and enjoy these machines. The
> doing is the important bit.

Exactly.

"Atari advocacy" means pro-atari chat, so why are we constantly
talking about Amiga and Mac, instead of what is still great about
using Atari?

Hi!

>How much ram in this Machine?

Only 4MB:-(

>Is there any other mods, such as graphic oriented and >such? Or is it simply an accellorated ST?

Yes, simply (SMD) CPU acc. + 64kb cache;-)

>This machine sounds like it could be competent web >browser?

Yes, CAB.

>Does he still use it regularly?

Yes, I use the STE very often.

>Would you like to comment and I'll pass them onto the >newsgroup or do you
>want to check out the newsgroup for yourself, it's >comp.sys.atari.advocacy
>and reply?

I hope you can read this:-)

4824. Oh... just one question... (he's back...)

Newsgroup: comp.sys.atari.advocacy
Date: 2000-02-03 00:00:00 UTC
From: Clockmeister <gerryvdb@tnet.com.au>
Message-ID: <jg_l4.368$iH5.14571@nsw.nnrp.telstra.net>
Source record: 2289

A friend has asked me to find out if the Milan II is likely to become available in Australia, as he's not online ATM. Does anyone here know of any dealers in Australia likely to distribute the Milan, or will my friend (an Atari user) have to order from the distributor in Europe?.

I thought my friends (?) here might have the answer.

(I said I wouldn't post again, but I guess I lied.)

Thanks all,

Regards,

Clockmeister.

HEY!!! I just went out and bought a DUMMY!!! Now what am I supposed to do
with it? Put it up for sale?

Actually, everyone outside of Germany and the surronding countries are
wondering the same. NA may get distribution. Don't know who handles them
Down Under.

If you Milan friend is anything like your friends here, you really must be
an unhappy lad.

No, we get on just fine. They are just computers you know, silicon and
plastic, hardly a big deal. It's not like there aren't more important issues
in the world today then who's computer is better.

LOL :-) I just thought of another place you could stick that dummy!!!

4827. New Milan II developments! 500 MHz G4 STILL Vapour!

Newsgroup: comp.sys.atari.advocacy
Date: 2000-02-03 00:00:00 UTC
From: "Daniel L. Dreibelbis" <dreibel@idirect.com>
Message-ID: <dreibel-AE5D2C.11560703022000@bigmomma.idirect.com>
Source record: 2292

So The iDiot Forever Known As Sinclap is still insisting that the much-anticipated Milan II that should be out this spring is vapourware, while steadfastly denying that Apple's promised 500 MHz G4 computer is equally vapour by his own yardsticks? Well again, Think Different.

Here's an announcement from Bengy Collins' MagiC Online site regarding an exciting new development in support for the new machine. Clockmeister should be interested in this announcement as well, as it involves the fact that an Amiga developer is doing this....

taken from http://bengy.atari-computer.com ......

"Below are the most recent articles for this month. Visit the News page for all of this month's news.

"Now official: Epic to make games for Milan! (Feb 3 00) Amiga users will surely know the name "Epic Marketing," as they are one of the biggest producers of Amiga-games. And now, they are officially supporting the Milan! Epic bought the rights to port 'Simon, the Sorcerer II" to the Milan and also plans on bringing their new Settlers-Clone "Foundation" to the Atari platform.

"Falcon users should be happy to hear that they also plan on releasing Simon on the Falcon030.

"Great news for all Atari users indeed."

Great news for Atari users, bad news for TiFKAS. For, as we all know, companies don't produce software for "vapourware products". The fact that they're going to be making Falcon games is also GREAT news. As well as the fact that an Amiga developer is going to be doing the programming, they seem to have a lot of faith that the Milan II is going to be an expected hit.

How would you like your crow, TiFKAS - stir-fried, boiled or fricaseed with a side of spinach? :)

And in other great news, Woller, a well-known German hardware developer, has confirmed that they're doing a DSP add-on PCI card for the Milan, thereby opening up using all the great Falcon DSP software like Cubase Audio Falcon, FalcAmp (mp3 player), Quincy, etc. Again, Woller is not the type of company who would develop for a "vapourware" product. Again, check out the news at Bengy's MagiC Online site in the news for January....

That gagging sound you hear is TiFKAS choking down more of his much-hated strained spinach :)

Oh, yes, the vapourware Mac 500 MHz G4 that TiFKAS swears up and down Steve "Arrogant Bonehead" Jobs "never promised a release date on", despite the evidence mounting that he did? Looks like it'll be at least another eight months before that computer ceases to be vapour, long after the Milan II's triumphant release - at least according to all the news wires carrying the story that Motorola is still having problems making stable chips and it'll take that long before we can possibly see Apple using these chips. Which of course means that companies like Intel and AMD have a nice head start with 700 MHz chips that reduce the G4 to blackened bacon...

Oh, and I've taken Brian Van Tillborg's (great guy, BTW, really glad to finally meet you at the last TAF meeting, you certainly have some good ideas for the club that I want to discuss with Ken) advice to take the Apple stuff to mac-advocacy. If you want, check out the thread there "500 MHz G4 Never Promised ?" to which both Mac and Windows users express surprise that someone like TiFKAS would be so dense to even claim that there was no release date promised for that piece of vapourware, and have even questioned whether TiFKAS is really an "Apple Power Rep" as he has claimed here for so long without one shred of evidence - and have even postulated that he could be reprimanded or even fired for his behaviour in this affair here should it turn out that he is employed by anyone at Apple or a related company for spreading FUD.

that thumping sound you hear is TiFKAS pounding his head on his desk next to his Commodore 64 while muttering under his breath "can't...kick...ass...can't...kick...ass....."

I'm sure we'll hear another categorical denial of everything from TiFKAS about all this, just as sure as he'll be hallucinating about his imaginary friend "Chunks" and equally imaginary "Atari Jihads".

Hi 'Chunks'!

> 2) thanks for confirming to all that the 500MHz G4, which had been
> officially announced and promised by Steve Jobs at Seybold on August
> 31st, 1999, and had orders taken for it, is officially vapourware.

And cancelled it. Vapor is when it's constantly promoted month after
month and delayed...the usual MS tactics...SJobs stated that the G4/500
would ship a few months later after the first two models completed the
ramp. When the 500 chip developed snags, Apple discontinued the entire
line for the new reconfigurations.. They did not adopt the Atari way
of things...Real soon now-like two years from now...Remember..."Were's
the Mega ST"?

> Admit it - you LOST.

You give the word comprehension a new meaning..

You're right...But when the Jihads claim that the current stuff is just as high performance to the current PPC and intel offerings, a reality check needs to be engrained...

> 6)Atarians....don't waste your time arguing the merits of the milan over
> the mac. The people who like 68k machines are interested already.

Yes they do..Say it ain't so Danny 'Chunk's Jihad..

BZZT! WRONG!

Vapourware is where it's announced and NEVER RELEASED.

Not only do you often attempt to rewrite your own history, now you
try to rewrite definitions to try to shore up your sagging arguments. A
lot of people I put up the question to in mac.advocacy not only disagree
with you, they also say you're lying....

SJobs stated that the G4/500
> would ship a few months later after the first two models completed the
> ramp. When the 500 chip developed snags, Apple discontinued the entire

> line for the new reconfigurations..

but still promised a 500MHz for the future, which now it seems
Motorola won't be able to supply for ANOTHER EIGHT MONTHS. Voila, vapour!

They did not adopt the Ataril way
> of things...Real soon now-like two years from now...Remember..."Were's
> the Mega ST"?

Remember "where's Copland"? "Where's Rhapsody".

We're talking about HERE AND NOW. You claimed the Milan II is vapour.
When I pointed out the 500MHz G4 is equally vapour by your yardstick,
you go ballistic and deny everything, in the process stuffing all sorts
of appendages in various orifices and making yourself an even bigger
laughing-stock...

Won't admit you made a boo-boo?
>
> > Admit it - you LOST.
>

what is "spiining", I believe it's spelled "spinning". More proof
that no one at Apple or related would hire such a moron...

and who's "jack"? he's probably as imaginary as your friend
"Chunks"....

the facts are that there are still many professionals who keep an
Atari around because it'll keep going wheras where the Mac crashes....We
have quite a few MIDI users, amateur and professionals, in the club who
can attest to that. I've also seen in London (a hotbed of professional
recording) where music shops often sell ST systems for around 200 UKP
becuase of their desirability.

And if the Atari has been abandoned, TiFKAS - then why is Steinberg
still making Cubase III available for sale? Not to mention my friend
Danny McLeer, whose Electronic Cow software company is doing well with
their wonderful selection of MIDI software.

Interestingly, I just helped a Mac-using musician with a question
about hooking up a SCSI hard drive to his 1040 STe. Sounds like he
hasn't abandoned his, and he still finds it useful.

TiFKAS not only doesn't know beans about the video industry,
geography, math and political science, now he also proves his complete
ignorance about the MIDI industry. When dealing with TiFKAS, Caveat
Emptor....

> Nope..Just crashes the program and reload..Forget to wipe the cache on
> Navigator and crashes soo often..Just reboot while on line..

uh-uh, TiFKAS. You seem to forget I use a Mac as well as Ataris. I know of what I speak.

MagiC is a pre-emptive multitasking system with memory protection. Current OS on the Mac is co-operative multitasking with NO memory protection. Which means - one program crashes, the entire thing goes. Or when you talk about "reload", you mean "restart"? Even when the program doesn't crash the computer and I'm able to get it out of memory, I'm warned to restart. BIG difference....

MagiC is not perfect, but it does its job a lot better than the bloated Mac OS. The fact that MagiC is backwards-compatible with every ST since day one means that STs are still useful while the equivalent Macs from that era are being turned into fishtanks....

and may I also mention nAES with MiNT. When Martin-Eric Racine did his demo at TAF and brought his TT, we saw an excellent operating system that looked good and ran well. Also pre-emptive multitasking, and has some great tools ported over from UNIX.

>
> You mean your pen--...?

why did you put those two -- after "pen", TiFKAS? STILL can't spell? Or are you afraid to spell out that your mind is unable to crawl from the gutter?

looks like TiFKAS has run out of arguments, now he's going back into "macho stud" mode.

he probably didn't, but neither did you, our favorite fake "Apple
Power Rep". Nobody at Apple or related would hire anyone who can't spell
"solutions".

Apple needs a solution to MIDI, now that Opcode has crashed and
burned....

>
> The Mac OS is moving on... is TOS? The Mac OS provides the best

again, TiFKAS gets it wrong. TOS is constantly updated by Milan GmBH.

TiFKAS is once again braying about how "superior" the Mac is. Lots of
happy people with PCs, Ataris and Amigas would tend to disagree....

>

I can't say that the "Milan" name is very inspiring. Bit boring actually.
I could suggest a couple of names...

I'm all for this Amiga/Atari de-facto arrangement. It can only benefit both
platforms.

Regards,

Clockmeister.

If this is the 060 PCI card for PC's to run Mac O/S, I think they dropped it becasue of a software dispute, or lack of support. The Web site is still up, and I haven't looked in about a year so things could have changed.

the story is talking about Simon the Sorceror, an Amiga game that
Epic Marketing is converting to the Falcon as well as to the new Milan.

Thats your definition..Apple did release the G4's after announcement.
But when the 500 chip had snags, Apple cancelled the model in October
with no further say about it. Hoping sometime next year that the G4
500 chip will be in better supplies. They did release three models..

> Not only do you often attempt to rewrite your own history, now you

I did not see the word 'promise' in any announcement..Big
difference..Apple did not issue at all an exact date or anything other
promises. What they say was if the supply of the 500 chip meets their
ramp number.

> They did not adopt the Ataril way
> > of things...Real soon now-like two years from now...Remember..."Were's
> > the Mega ST"?
>
> Remember "where's Copland"? "Where's Rhapsody".

Copland is ancient history..Kaput. Parts of Copland became Mac OS 8,
8.1, 8.5, 8.6 and 9.0...Rhapsody became Server X...Nice try..

Loyalty..But the end is here. Many will upgrade to the other
platforms..

> Interestingly, I just helped a Mac-using musician with a question
> about hooking up a SCSI hard drive to his 1040 STe. Sounds like he
> hasn't abandoned his, and he still finds it useful.

For secondary use not primary. Why did he have to upgrade to a mac in
the first place considering you claim that the TOS midi solution is
still number 1..?

> TiFKAS not only doesn't know beans about the video industry,
> geography, math and political science, now he also proves his complete

from MacWEEK <http://macweek.zdnet.com/1999/10/10/configs.html>

Confirming an earlier MacWEEK report that production of 500-MHz G4
processors has been delayed because of technical issues, Apple said
that the "500-MHz G4 processor will not be available until the first
calendar quarter of next year."

it's now getting pretty near the end of the first quarter, TiFKAS. No
500 MHz G4 tower in sight.

want salt for your crow?

strange that the MIDI magazines I read mention Atari in glowing
terms. Strange that at least two British MIDI magazines still offer
Atari software from time to time....

>

yep, the end is here. Unfortunately, TiFKAS doesn't know which end is
which. Which makes sense, since TiFKAS couldn't tell a postbox from an
elephant's posterior...

Nice new beginning with Milan.
>

so what, TiFKAS. And if Apple is doing so well, why did they fire the
entire UK and German marketing arms? Does Jobs have to let go more
little people in order to keep up an artificial large balance for the
ledger books?

> > uh-uh, TiFKAS. You seem to forget I use a Mac as well as Ataris. I

again, WRONG. I've had some serious system crashes, not only on
Netscape but other programs, where the entire Mac froze. And I've heard
lots of complaints from both Netscape and IE4 users about this happening.

When CAB does that under MagiC, it boots out of memory cleanly when
removed, and I can proceed with what I'm doing without rebooting....
>
> > MagiC is not perfect, but it does its job a lot better than the

that's becuase you've never used MagiC. In fact, you've admitted
you've used a TOS 1.0 version of an ST ONCE. Some "expert" you are,
TiFKAS - now, can you advise us how to perform brain surgery with
plastic restaurant utensils?

BTW, it's spelled "running".

>

Because they only mention what brands advertise in their pages.
Atari is not likely to advertise anything anytime soon. Still,
read just about any article in Future Music or similar magazines
and you notice that real MIDI musicians still use Atari mainly.

> When Netscape crashes, does not take the system dowm..Just
> reboot the program while on line..Is that better now?

Oh, but it _does_ take the system down. Windows _has_ to be
rebooted.

No, you are.

Dan's point was stability and reliability, which has nothing to
do with quantity. Atari MIDI hard/software needs no novelty,
because it needs no fixing.

> > > The Mac OS is moving on... is TOS? The Mac OS provides the best

> >
> > Far from it, thank you. Try Netscape on Linux.
>
> And in what way?

The Linux version supports more character-sets that either the
Mac or PC versions, integrates well in a multi-user environment
and makes use of built-in Linux networking functionalities to
make it easier to perform user identification and secure
transactions. Neither the Mac/PC versions allow that.

> > Same with Mac. Things just _never_ work out of the box.

After years of serving the needs of MIDI musicians in a music
store, I can definitely confirm that Mac/PC MIDI stuff is not
as plug & play as people wanna think. More like, plug & pray.

It's the same anywhere outside North America...

I would buy an iMac, but definitely not pay twice the price of a
well-equipped PC. Here, the "basic" iMac 350 sells for 8000 FIM.
For that price, I can buy a couple of well-equiped hi-end PCs.

Thanks, and I don't think Mr Sinclap fools anyone here into thinking that his comments are in any way based on fact. Anyone who actually believes the Apple marketing BS to be gospel is obviously pretty gullable. Blind faith perhaps?.

Anyway, for what it's worth...

Regards,

Clockmeister.

Don't count your chickens yet..It's easy to post a new press release stating..Due to the sorry nature of the market it's not feasible to

suppor this platform...

> How would you like your crow, TiFKAS - stir-fried, boiled or
> fricaseed with a side of spinach? :)

I am in the mood for cherry cheasecake with vannila ice cream..

Apple officially cancelled that G4/500 in October with the announcement
of the new reconfigurations. The model number no longer exists. Apple
has not talked about that model..If an early new year was given, than
it could be from Jan. 1 to March 31.

FYI: The G4/450 is upto twice as fast as the PIII 700!

> Oh, and I've taken Brian Van Tillborg's (great guy, BTW, really glad

Who elected Ken to tell others were to post? Time for him to leave
academia for the real world. If he paid the kind of taxes I paid, than
we should talk..

The G4/500 that Apple announced in August has been cancelled. The
model number no longer exists..

> that thumping sound you hear is TiFKAS pounding his head on his desk

I take it you have read the posts of tom elan in the mac advocacy group?
Well, I am going to do a post inspired by him:

What has this got to do with atari advocacy?

We all know advocacy groups are platform vs. platform, but he doesn't :)

It is not. Woller has yet to announce anything vaporware.

Apple avoids talking about anything, because they cannot
deliver anything.

> The G4/500 that Apple announced in August has been cancelled.

I think the question was worth $64,000. Nintendo was one of the other answers (the rest I don't recall).

> Btw, it isn't an american quiz show.

Yes, as I've discovered here, it's based on a British show. What I saw was the American version.

where can I buy a vapour 500 MHz G4 tower?

Milan exists, TiFKAS. Just because you can't find one yet in your
neck in the woods doesn't mean it's vapour...

>
> > Here's an announcement from Bengy Collins' MagiC Online site

This coming from the loser who claimed that the Gateway Amiga would
"crush" the Milan project. Only to turn out that the Gateway Amiga was
nothing but >VAPOUR<.

TiFKAS just loves playing from the middle - which is where he always
gets crushed.....

>

beginning of MANY new games, TiFKAS....

maybe you should learn to read (or at least count) - you'll notice
TWO games were announced....
>
> > "Great news for all Atari users indeed."
> >
> > Great news for Atari users, bad news for TiFKAS. For, as we all

> stating..Due to the sorry nature of the market it's not feasible to
> suppor this platform...

and of course, TiFKAS again tries to claim how much he knows about
the Atari computer market - when we all know that it's BEANS.

Motorola's involvement in the project, and HP's commitment in
peripheral support, is the best news in years, and gives a lot of
confidence to developers to go ahead with projects. The fact that
there's a new version of Calamus coming (confirmed) and a new CAB web
browser (also confirmed) shows the confidence is there.

"Counting chickens". No. TiFKAS once again playing Chicken Little?
YES. Face it, TiFKAS, we ain't going to roll over and die. Give up.

BTW, it's spelled "support". And the syntax of the above sentence is
terrible.

>
> > How would you like your crow, TiFKAS - stir-fried, boiled or

oh yes, when you predicted that the Playstation Emulator for the iMac
would be "getting a licensing deal from Sony soon", when instead it was
crushed by Sony's army of humourless lawyers?

But you should know about what you speak there, after all, it was
just as easy for Steve Jobs to announce a 500 MHz G4 Tower available
RSN, but delivering it is another issue...

BTW, it's spelled "We'll".
>

> quarter of next year."

sounds like a firm promise that they'll deliver. It's the middle of
February. And it's Apple talking to journalists, which - surprise -
makes it official. And officially vapour.

>
> FYI: The G4/450 is upto twice as fast as the PIII 700!

and again, you're wrong. Apple bases their FUD on flawed benchmarks.
Even Dan McKnight at Low End mac says that any claims of this are bogus.

>

time for TiFKAS to enter the real world. He can start by getting
glasses and re-read what I had written, I was talking about ideas that
Brian had made for improving the club where I wanted to talk to Ken
about. Ken doesn't tell anybody where to post.

I was talking about posts I had made asking about how someone
claiming to be an "Apple Power Rep" could claim that the G4 isn't vapour
when it obviously IS.
>
> The G4/500 that Apple announced in August has been cancelled. The
> model number no longer exists..

But it is still promised for delivery RSN, Apple promised that to
MacWEEK. Still vapour....

Oh, yeah sure. Have you used a PIII 700?. Twice as fast if shot from a
rocket launcher perhaps, but otherwise no chance. It is a nice chip, but
only a braindead Apple "groupy" would believe that claim.

Right, but nonetheless it was announced and now vapourware.

Hey Clock, are you implying they let sinclap have a quality piece of british computing technology like a ZX spectrum? I'm appalled. Somebody should repossess it. Lightning fast processor speed an all....

BTW, did any of you audio geeezers know that there is a danish synth called the sid station that uses the C64's SID chip as a MIDI controlled analogue synth module? How cool.

Oops..Who crushed whom chunk's?

Press Release

DATE: February 10, 2000

NEWS: Connectix Announces Decisive Victory in Sony Lawsuit

SAN MATEO, Calif., February 10, 2000 -- The Ninth Circuit Court of Appeals decided
today to "reverse and remand" a Preliminary Injunction on sales of Connectix Virtual Game
Station on all counts. Shipments of Connectix Virtual Game Station for Macintosh will begin
immediately. Online sales at www.connectix.com began today and a Windows version will
ship shortly.

Connectix Virtual Game Station is the award-winning software that enables many popular
PlayStationï¿½ games to run on G3 or G4 Macintosh computers (including iBook and iMac)
and soon on Pentium II Windows PCs. Sony brought suit to suspend sale of the product
claiming copyright infringement and tarnishment of the PlayStationï¿½ name and other marks.
Based on these claims, in 1999 a U.S. District Court temporarily blocked further shipments
of the Macintosh version and the release of a Windows version. Connectix has won the
appeal at the Federal appellate level on all counts and may now resume distribution and sale
of the products. The case has been remanded to the district level for final resolution.

The 25 page finding is available under case 99-15852 at http://www.ce9.uscourts.gov/web/newopinions.nsf

"The court has recognized that reverse engineering is a common, legitimate, and valuable
development practice, protected under law," stated Roy McDonald, CEO of Connectix. "We
are pleased to be able to bring our product back to the Macintosh community and launch it in
the Windows market. Now consumers on both platforms will enjoy their right to choose to

play PlayStation games on these computers, and Sony and game developers can benefit from
the expanded market for their games as a result of this choice. We believe this landmark
decision will have broad ramifications throughout the software and other media industries.
This ruling supports the clear goal of US copyright law to allow fair use of prior works to
create new intellectual property which broadens consumer choice. This is a great victory for
every American."

The United States Court of Appeals for the Ninth Circuit found:

Page 1703: "The Virtual Game Station does not contain any of Sony's copyrighted material."
Page 1704: "The intermediate copies made and used by Connectix during the course of its
reverse engineering of the Sony BIOS were protected fair use, necessary to permit Connectix
to make its non-infringing Virtual Game Station function with PlayStation games."
Page 1721: "Sony understandably seeks control over the market for devices that play games
Sony produces or licenses. The copyright law, however, does not confer such a monopoly."
Page 1725: "Connectix's reverse engineering of the Sony BIOS extracted from a Sony
PlayStation console purchased by Connectix engineers is protected as a fair use. Other
intermediate copies of the Sony BIOS made by Connectix, if they infringed Sony's
copyright, do not justify injunctive relief. For these reasons, the district court's injunction is
dissolved and the case is remanded to the district court. We also reverse the district court's
finding that Connectix's Virtual Game Station has tarnished the Sony PlayStation mark."

For detailed product information visit the Connectix Virtual Game Station website.

Connectix Corporation Founded in 1988 and based in San Mateo, California.
Connectix Corporation is a leading developer and publisher of cross-platform technology
solutions. The company's flagship products include Connectix Virtual PC for Microsoft
Windows, Connectix Virtual PC for Red Hat Linux, and Connectix Virtual Game Station.

Not to mention: would you WANT to?

PPC clones are on their way and you can get a dual P3 with
twice the MHz for half the price of a 450Mhz Mac. The same
will be true for uniprocessor P3's and Athlons before too
long.

Who cares?.

Bleem, the PSX emulator has been available for the PC for ages. Even works
fine on my P233MMX.

Regards,

Clockmeister.

Yeah, the calculator looking thing :-). Used a Z80, enough said.
(I don't wan't to go there, we'll have every Pom and his ZX in here
argueing the merits of the ZX :-).

Yeah, they know. It is pretty cool, but the remaining C64/C128 users crowd
don't like it because they are pinching SID chips out of working C64's.

I don't think they'll sell 20,000,000 units, so nothing to worry about ;-)

>useable.

Agreed.

>1) My STE is great for sequencing on location....far more stable in
>transit, and less of a fragile liability than the Mac or the PC.

The obvious benefit of the ST is unknown to one who has never used one.
Particularly for Midi and Transportability.

>2) Tos and multitos have proved to be stable, easy to use, intuitive and
>user friendly.Windows? You wish. Mac OS? Better, but still flawed.Both
>are vastly better equipped and bigger, but are they as stable or easy to
>work with?

I wouldn't say Multi Tos is stable. It does have flaws. But MINT, Magic and
Geneva, the alternate TOS Multi-Tasking OS are indeed very stable by
comparision.

Bigger is not better. It can be prettier at times. But the best part of an
ST is that it is down and dirty. It is up and running in a flash, easy to
use and rock solid. The main thing is still how much the humble ST can do
faster than a current computer. Tasks that don't require Horsepower, but a
logical quick piece of software. While maintaining the benefits of a GUI.

>3)y Falcon is great for samplers with SCSI, and Cubase Audio Falcon
>really works....I've spent thre years trying to make my p200mmx system
>integrate at all.

You've spent time, whereas you are required to spend money, and ALOT of it
to do the same as a Falcon.

>4) These computers are fun.... and the small industry of people
>developing new upgrades/machines/software are part of the minority who
>still enjoy them. What's wrong with that?

Nothing, infact that is what makes these computers fun.

>5)In terms of speed/power/ram etc etc what is the point in comparisons
>with a 700mhz athlon or 450mhz g4? Pick on someone your own size, who

>isn't fifteen years out of hi end development.

It is the burden of the OS that allows for such comparisons. It is a complement to the 15 year old computer. They can pick on the ST all they want, but it is the users who get the final say:-). Why discard something that is still receiving current software? Current software, quite a statement for an Atari:-).

>6)Atarians....don't waste your time arguing the merits of the milan over
>the mac. The people who like 68k machines are interested already.

Aye, and I should have one come year end. Should be easier to get than a Graphic card for my TT.

>7)This newsgroup is called Atari advocacy....that means finding a reason
>to still use and enjoy these machines. That doesn't mean "let's try and
>tell everyone that our machine is the best computer in the world". The
>doing is the important bit.

Couldn't be closer to the truth. Usually the functionability of the computer determines its reason to still be used. When it no longer serves the function the users needs it for, then it will find its way into the closets and dumps. I wouldn't say "best computer in the world" but I think best of 1985, and IIRC it did win an award for Best of 1989, which to me was a little puzzling.

>Oh and lastly....sinclap....this isn't a mac newsgroup. So don't post
>loads of stuff about how you thisnk ataris make good paperweights

Actually he doesn't. He only posts mac stuff. He doesn't have the slightest idea what an Atari is or what it will do. Claiming to own one, means nothing, using one is completely different.

...no
>one really cares what you think (though we are all impressed at just how
>long you have been hanging around this NG...nothing better to do?).

How long has he been around? I have only been here a couple years.

>Besides, if apple are top o' the world, what do you care about a
>minority machine with only hobby and hack users?

He wants one, so that he can learn something and possibly have something in common with the users here. To ashamed to admit it. However, from what I gather the Mac users don't agree with him, so perhaps its time he switch, and realize how good the Ataris are.

>P.S. I kinda like the idea of beOS.....looks like the mac front end,
>powerful and ultramodern, no legacy layers, total hardware
>integration....anyone actuallly using it yet? Is there a 68k version?

Apparently not, but I don't know why. Probably the answer why will be deeper in this thread which I haven't read yet;-).

Later Brian.

>midi soltions..

You are treading on thin ice here. Don't start speaking of a subject you know absolutely nothing about. I don't use Midi, but I am forever, finding Ataris for people to use for Midi computers to replace their PCs and to complement their Macs. Doing Midi better, and easier than the Macs.
I don't know the details, its what they want, many having left Ataris under the assumption that Macs where better only to realize the need to return to Atari.

Always on Demand for musicians are
Stacys, STs, and Falcons.

When new stuff is developed for the Macs perhaps it should be good enough to replace what the Ataris are used for? Until this happens demand for the above computers and various midi software remains high.

>> 2) Tos and multitos have proved to be stable, easy to use, intuitive

>The Mac OS is moving on... is TOS? The Mac OS provides the best
>internet experience...

Hello? Do you digest anything you read here? Yes, TOS is moving on, it is new for the Milan. Then the likes of Magic and Mint, are also moving on, and currently superior to the Mac OS. The question may be..

Why can't a large company keep up the the OS of an obsolete computer? Amigas had Premptive Multi-Tasking, My ST running Magic has it? What about you? Do you like using an Obsolete OS? RSN right?

>> 3)y Falcon is great for samplers with SCSI, and Cubase Audio Falcon
>> really works....I've spent thre years trying to make my p200mmx system

>Yea so..?

If you knew what he was talking about, you would be having similar problems with the Mac. It is simple on Ataris. Simple and Easy which is why Musicians like Ataris.

>> 4) These computers are fun.... and the small industry of people
>> developing new upgrades/machines/software are part of the minority who

>> still enjoy them. What's wrong with that?

>You're right...But when the Jihads claim that the current stuff is just
>as high performance to the current PPC and intel offerings, a reality
>check needs to be engrained...

Depends on what you are doing. Your claims of Mac to PC in performance are
actually more Absurd than Milan Comparisions.
Milan comparisions are based on OS and Software. Horsepower is not bogged
down by the OS. Whats wrong with talking about an Excellent computer.
STs weren't the fastest easier, but they were the best:-).

>The charter is defined as attacking and defending the Atari ST way of
>things..

Your knowledge of Atari shows that you are clearly unarmed.

Much to their regret they leave. The biggest reason is a breakdown in support and distribution. Many are still being used in peoples homes and studios to this day. But like I mention earlier. Often, very often, I am asked to look for Ataris for Musicians and Music teachers alike.

Even more important is the software. Their isn't alot of spinning. Dans first statement is correct, because its what the mags still talk about, and what I hear from musicians alike. They are still looking for solutions to top 15 year old Ataris.

> NEWS: Connectix Announces Decisive Victory in Sony Lawsuit

of course, TiFKAS once again mindlessly posts a press release before actually reading what it says.

But, according to Macintouch, it appears that this still isn't quite over yet. And I believe Sony can appeal the ruling, of course - it'll be interesting to see if it does go all the way to the US Supreme Court.

Of course, Connectix can still lose if the judge decides not to award them the proper amount of possible damages. Remember the case USFL vs. NFL? Although the USFL proved in court that the NFL used their monopoly to undermine them, the judge only granted them $1 in damages. Result? USFL: toast.

But of course, the real proof of the pudding is going to be now if Connectix can now actually sell the Playstation emulator again - because of some interesting things that are happening.

Did you know, for instance, that the big Mac mail-order houses have been blowing out their stocks of the original release, because nobody was buying them? If you take a look at MacAddict's ads sections, you'll see VGS for sale for as little as $19.95 US - a true fire-sale price. Who's going to stock or sell again at a higher price a product that has proven to be a real sales dog?

Oh, and howzabout the fact that while Connectix was busy in court, a product called Bleem, also a PlayStation emulator for the PC, has been quietly racking up big sales in the very market that Connectix was aiming VGS? So even if Connectix can produce a VGS for PC that they're planning to, it's too little, too late. The fact that Connectix did well

in the case can also backfire in their face as well, since the manufacturers of Bleem, who are now also being beleaguered by Sony's army of humourless lawyers, can now use the precedence of Connectix' "victory" to have the case thrown out of court at little or no cost to them.

Oh, and did I also mention that PlayStation 2 is expected out soon? Which means that the new games WON'T WORK on VGS. Who would want to spend money on something that would allow them to play games on something that was now less than cutting edge? I also bet that Sony may have a few tricks up their sleeves for any future releases that'll prevent new games from running on VGS.

But, of course, this leads back to the original TiFKAS "prediction" - that Sony would capitulate immediately and grant an official license to Connectix. Which they didn't, and they NEVER WILL.

We've got you swinging by your toes, TiFKAS, and twisting slowly in the breeze.....

Ofcourse, but there is a good reason as to why we stick together...
Living upside down (as you put it) means that all the blood rushes to our
heads, and consequently we are infinetely smarter then those who live
upright. Us Kiwi's and Aussies are on similar (but not the same :)
wavelengths.

But you would have already realised that ;-)

Regards,

Clockmeister.

4880. More new Milan news! 500 MHz G4 Tower STILL Vapour!

Newsgroup: comp.sys.atari.advocacy
Date: 2000-02-13 00:00:00 UTC
From: "Daniel L. Dreibelbis" <dreibel@idirect.com>
Message-ID: <dreibel-03CE3A.01080013022000@bigmomma.idirect.com>
Source record: 2245

More good news for Atari users - more bad news for The iDiot Forever Known As Sinclap....

this can be found, as usual, at http://bengy.atari-computer.com .

(Feb 11 00 2nd update) Volker Ritzhaupt, one of the head hauncho's at ASH, was recently interviewed by the German macintosh information site, Mac Gadget. The topic of Atari and MagiC comes up several times, and when the question of how much longer ASH will support Atari is asked, a reassuring reply is answered: As long as we can. He goes on to say that they still have some surprises up their sleeves for the Atari platform, and that they plan on adding internal 68k emulation to a future version of MagiC Mac in order to avoid problems with Mac OS X. The interview is in German and can be read here.

< See? Software still being developed. ASH has confidence that the new Milan II, despite TiFKAS' desperate attempts to FUD it out of existance, is going to make sure the TOS platform is going to around a long time. The news that ASH will also be developing a new version of MagiCMac that'll work on OS-X must really being sticking in his craw...>

Watch TV on your Milan! (Feb 11 00 1st update) Although work is still being done on the Falcon-Compatible Milan DSP card, Woller has confirmed that they are also working on another exciting Milan development: The Milan TV Card. This card will allow you to connect your video camera and VCR to the Milan, thus allowing the possibility to record or capture images and video. Another use of the card would be to , of course, watch TV in a nice GEM window. This card will possibly be released even before the DSP card.

<ah, this confirms what was being touted by many pundits at the outset - that one of the strengths of the new Milan will be audio/video editing and production. Of course, TiFKAS will use all sorts of excuses to shore up his sagging campaign of anti-Atari FUD - including claiming that the new card is "vapour", despite the fact that Woller has always delivered on its promises. And we here think that when the new Milan rolls out, it'll do a much better job than the buggy, horribly unsynced iMac DV, which I recently saw being demonstrated in front of a crowd of people in a Mac store who were clearly unimpressed at the poor DVD performance. Of course, TiFKAS will claim "just wait until the next software patch comes out" - well, here's a clue: IT'S THE HARDWARE, STUPID. Real computer companies fix the serious hardware problems BEFORE they ship....>

I will repeat this once again for the benefit of everyone.

In terms of price:

Mac G4/450 ~ Dual P3/700 PC

[deletia]

iMac's dont even test well against similarly clocked Celerons,
nevermind P3's and Athlons clocked twice as fast...

Tyan Tiger + 2 P3 500's: $600
Abit BP6 + 2 Celeron 500's: $235

The rest of a system is the same price as it would be otherwise.

Systems can be found (in the usual places) for $1600
including G400 video and 19" monitor.

450Mhz G4's (with no SCSI) START at $3500.

Similarly priced PC's (still dual PIII) include things
like RAID5 controllers, tape backups and multiple SCSIUW drives.

You can take 'only the brand name' route and still come out ahead.

Things don't even out until you get around the Dual PIII/700 range.

Apple simply isn't something that you market based on price
or price/performance. It's simply not it's strong point and
never has been.

Lets see..While the Milan II is attempting to swim to the Boston Harbor, Apple has dealt a knock out blow from Tokyo! You see...The PM G4 line has been revised for the fourth time since August with the release of the new 400,450 and 500 model! But the most important release today is the new firewire PB G3! ...with speeds upto 500! Oh...did I mention the new graphite iBook?

So..Revamping the entire line is no feat for the amateurs.. I forgot to mark my Palm calendar...Wehn will the Milan II be released in significant quantitiies at the shores of Boston Harbor?

sinclap!

Somewere in Wisconsin...

> Who's going to stock or sell again at a higher price a product that has
> proven to be a real sales dog?

Yes! Remember it was released months ago with an uncertain future.
Game titles also fall in price as well during the normal product life
cycle. Doom costs $9.99 now..Whats your point?

> Oh, and howzabout the fact that while Connectix was busy in court, a

and a partial translation from AltaVista...

"Volker cutting head, managing director of Application of system
Heidelberg

The questions:
Where are the roots of the enterprise?
How long will Application of system develop Heidelberg still for the
Atari?
How do you judge the present situation of Apple in Germany?
What do you hold from MacOS X?
How do you see the co-operation of Application of system Heidelberg and
Apple?

MacGadget: Mr. Ritzhaupt, Application of system Heidelberg entered only
some years ago into the Macintosh market. The roots of your enterprise
are however unknown to most Mac users. Indicate to our readers briefly
the firm history of Application of system Heidelberg.

Volker cutting head: Application of system Heidelberg was created in
October 1985 and the emphasis of the business activity was situated
first with the development and the selling of software for the Atari ST
computers, which were very successful at this time in the
semiprofessionellen and home area. ASH developed here and drove programs
out within the area text processing(Signum), programming (pure C, pure
Pascal, megamax of Modula 2), data base (Phoenix), spread-sheet analysis
(Texel), diagram (Artworx, Papillon, STAD), later also Internet (ASH
more eMailer, A-CB BROWSER). Furthermore we developed a Atari compatible

operating system named MagiC.

ASH took a market leader role in the Atari market here within some areas. 1994 stopped Atari the development and the production of computers. With MagiC Mac could supply 1995 a Portierung Atari operating system of the MagiC on the Macintosh to ASH with and 1996 with MagiC PC a version for Windows PCS. The turnover proportion with Atari products is today high with 25% still amazingly, will however inexorably shrink, since it concerns with the Atari a becoming extinct kind.

Starting from 1997 an increasing activity took place in the area Macintosh software development and - selling. Here ASH brings won technical Know How into own Mac developments or licensed (e.g. control fox (income tax return), BankUp (Homebanking)) and in the case of product translations. Selling become both applications and plays for the Macintosh. These are translated often complex and become normally licensed from American partners.

In the area of applications for example REALbasic (Visual basic compatible development system) or Freeway (Web Design Tool) is even final translation projects. Furthermore we translated the Mac Client to AOL 5,0 and to negotiate even with IBM because of the translation of ViaVoice. ASH takes over typically an exclusive distribution, which includes all areas, thus production, selling, Public relation, advertisement and qualified product support.

MacGadget: Application of system Heidelberg showed up very actively last in the German Mac market. They function as Distributor, compilers/translators and developers. Which future plans have you?

Volker cutting head: Since Apple offers meanwhile attractive products for the final endkundensegment and so that also in the USA and Japan is already very successful, we apart from self-developments strengthened also about postage portierungen of successful Windows software to worry in the future. Here we would like to essentially concentrate on things, which are particularly interesting for the German market, since it is hardly to be expected that for example US software houses become active here. Two concrete projects are with large German publishing houses at present in negotiation. It is not to be counted however before end of the yearly on a product.

Furthermore koecheln with us still a few new developments, about which we would like to say nothing more details to the current point in time still. I can say only as much that we have from the Atari page on a lot of pfiffiger programmers Zugriff and since still many surprises in it are.
For example has iCAB its roots also in the Atari Browser CAB (Crystal Atari Browser, if already times someone should have been surprised over the strange names).

Still something: We therefore always resist the term Distributor, because that has to do something with Kistenschieberei, which is not

very customer friendly usually. We make however somewhat more, because thus that we worry about it, almost completely available German resources for example with plays to constituted and for the Mac to process we provide for the availability of a product, it without us would not give (thus e.g. German Tomb Raider, the cent, alpha Centauri, Balduri¿½s gate etc.). Does not make such a thing a Distributor.

They would not consider it possible in which catastrophic status manuals for PC versions by plays to be delivered. In the the cent manual for example the author weights about the fact that the players never read the manuals. Naja, why also, if in the same manual each quantity semifinished records and senseless things is contained. We cannot correct everything here, because the expenditure would not be to be mastered temporally, but we make understandable from it with the help of the English manual at least somewhat (one, because one does not understand otherwise the translation) needs the English manual. In all other respects applies sowas also to the software: Duane Johnson, the the cent did not portiert, has me told that he recovered some heavy errors in the cent, the anything with the Portierung to do had and thus exactly the same in the PC version weiterschlummern. We have ourselves to undertake over missing umlauts on the Mac excited and tried against it something, but it stops one already the mouth openly, if one sees that the PC version has exactly the same Macke and is exactly the same delivered."

Who were _known_ by the RCMP to be a very small group, as the
book on the history of the SCRS's creation tells in details.

> and secondly - who said Quebecois were ever 'our own
> countrymen' ???

In this case, please do us both a favour: ask your provincial
prime minister to promote Qui¿½bec independance so we can get this
400 year old mistake over with and go separate ways. Thanks.

At what cost though?. Waaayyyy too pricey for an underpowered (by PC
standards) computer.

> So..Revamping the entire line is no feat for the amateurs.. I forgot
> to mark my Palm calendar...Wehn will the Milan II be released in
> significant quantitiies at the shores of Boston Harbor?

As the Milan and Apple products are aiming for entirely different markets, I
don't see any relevance.

Besides, you yourself suggested that the Atari line is on life support.
Apple dealing a supposedly "knockout blow" to the Atari market isn't
anything to get too excited about then is it?.

The fact that IBM compatible sales numbers are rubbing copious amounts of
faeces in Apple's face is a more telling sign of the real world relevance of
Apple computers today.

Regards,

Clockmeister.

They could also just bundle an ATI Rage128 VR card as standard, as such
a card (and many others) have composite and S-Video in/out as standard.
Just a matter of writing drivers to hook into the video ins/outs...

With well written GEM software a nice piece of video-editing could be
achieved...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

A wonderful piece of computer history...or computer 'now' if I'm not mistaken!

I regularly use my Falcon or PowerMac Speccy emulator to play Sabre Wulf,
Alien 8, Knightshade, Jetpac, Manic Miner, JSW and all the old favourite
games! I'd use my real Spectrum if it was quicker to load the games from
tape! :)

I do agree that letting a pretend Apple 'power rep' at a Spectrum should
be deemed a heinous crime...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

the very 500 MHz G4 that you swore up and down never existed, would never be released, and were trying to deflect to show your complete ignorance of Apple's policy - which once again proves that you're only pretending to be an "Apple Power Rep".

Compared to me, who pointed out that Apple kept promising it.

Ready to wipe the egg off your face, wienerhead?

Meanwhile, AMD introduces an 850MHZ Athlon that stomps all over any 500 MHz G4. Too little, too late....

And even more embarrassing - IBM releases G3s that are even faster than the too-little, too-late 500 MHz G4 - 600 MHz, baby! - that Apple will probably never release in product for the embarrassing fact that they'd have an "inferior" chip that was faster than their flagship chip.

Yep, TiFKAS is still swinging by his toes....

Yeah, I know there were some underhanded things going on before the
vote. But they came from both sides, so all is fair in politics. There's
a lot at stake.

> > Provincial leaders are called premiers, not prime ministers
>
> Bzzz... That's incorrect English. Even a bloke should know.

Don't put your foot in your mouth.

You said "ask your provincial prime minister...". That title doesn't
make sense. And please explain the details of my grammatical error (as a
bloke I don't see it). I'll refrain from pointing out your numerous
spelling errors (too many for someone who supposedly teaches English).

Blame the Catholic church: ridding the New World of "pagans" resulted in
many terrible things. My point is that there were distinct societies in
Canada before the Europeans arrived. Quebec would have to be split with
the aboriginals.

> > With such ethnic diversity in Canada, why is it that the

But a strong central government is important.

I live in a city (Vancouver) of ethnic diversity. In my mind there's no
myth (ask the UN). Things aren't perfect but everyone seems to be
co-existing just fine. Maybe we're just more tolerant out here. You
wouldn't know that, though, because you're not in the country.

>
> Oh gawd! Admit...you lost!

nope, YOU are still losing:

found in MacGamer's web site:

MacNN has some excellent coverage of the decision and its
implications, andnotes that the case against Connectix still exists in
the lower courts, as Sony has also alleged that Connectix has infringed
upon patented trade secrets:

The case against Connectix still lives on despite the higher court
ruling and has been sent back to the district court for final
resolution. The lower court can no longer rule on the tarnishment or
copyright issues which will effectively end the case, but another case
is pending before the court on Sony's allegations of trade secret
infringement by Connectix's. McDonald is confident Sony's second case is
without merit and will be dismissed.

Does THIS sound like it's "Over and done with", weinerhead?

>
> Connectix did not seek damages dumbass! Just the right to sell it!

look who's calling who a "dumbass".
>
> > But of course, the real proof of the pudding is going to be now if

> Yes! Remember it was released months ago with an uncertain future.
> Game titles also fall in price as well during the normal product life
> cycle. Doom costs $9.99 now..Whats your point?

that VGS has tanked - and tanked badly.

And you're comparing a no-hope Playstation emulator that has done
SQUAT in sales with the multi-million dollars in sales DOOM? A game
that's been around since 1993, (1994 in Mac years) and has sold millions
of copies, compared to VGS, which has been out nearly a year? DOOM,
which is STILL being developed by third parties and has a wide-ranging
base of fans (www.doomworld.com)?

yep, games drop in price. That's why PC gamers can buy the original
Tomb Raider for $9.99 CDN, while Mac TR fans pay through the nose at $40
and up for the same game....

John Carmack and I both laugh at your sorry ass. Man, how clueless
can TiFKAS get?

>

> > them.
>
> There is only three strikes in an out..Want a fourth one? Your
> predictions are about as accurate as Bush's pollster.

And your propensity for truth is as lame as Bush's father's.

Great moments in American Truth:

Joe McCarthy: "I have in my hand a list of communists"...
Richard Nixon: "I am not a crook".
George Herbert Walker Bush: "Read! My! Lips! No! New! Taxes!"
Bill Clinton: "I did not have sex with that woman!"
The iDiot Forever Known As Sinclap: "I never called Steve Jobs an
arrogant bonehead who would destroy Apple if he ever came back"

MY predictions are based on common sense - YOURS are based on uncommon nonsense, and have as much structure as a souffle in an earthquake, and as much staying power as flatulence in the wind.

again, from MacGamer...

There has been much speculation as to what a new version of' VGS might entail - better game compatibility and InputSprocket support would seem to be mandatory improvements, but many have expressed hopes that Connectix will include 3D hardware support (via RAVE or OpenGL) such as demonstrated by the PC PlayStation emulator Bleem!. Unlike the current VGS, which uses ATI hardware merely to scale the image up to 640x480 resolution, a 3D enabled version would actually use 3D hardware to draw game polygons, allowing for greater resolutions and less "pixelation" of game graphics in 3D-based games. However, it is too soon to predict what direction VGS will take, and since they have not been developing the software pending the court decision, it may be a few months before we see a new version.

see - while VGS is still based on old technology, Bleem! uses cutting edge hardware to stomp all over VGS. And every moment there's no Mac or PC VGS that supports the cutting edge , Bleem! takes market share away from any hopes that VGS will do well.

Separated at birth: TiFKAS. Toast.

HOME RUN!

Hope your not a
> stock broker or advising the cretin Creighten or what ever his name
> is..Is Joe Clark still around?

Yep, leader of the Conservative Party, years after Mulroney conveniently abandoned the party like a rat leaving a sinking ship - that is, right before they were decimated and humiliated by a Liberal landslide. Joe is holding his own, thank you very much..

TiFKAS I compare to Presto Manning's attempts to get a new right-wing party going - and both are full of CCRAP (they not only are stupid enough to pick such an obvious acronym for their name, like TiFKAS they can't even spell....)

Your spelling is still atrocious. It's spelled "you're"...

Off topic here..Why do you treat your
> former Prime Minister's to shably? Former U.S. Prez still get the
> trappings of the office such as security, limoes with Secret Service

4902. Connectix has a setback, TiFKAS still loses!

Newsgroup: comp.sys.atari.advocacy
Date: 2000-02-17 00:00:00 UTC
From: "Daniel L. Dreibelbis" <dreibel@idirect.com>
Message-ID: <dreibel-BB9C02.14184017022000@bigmomma.idirect.com>
Source record: 2117

So, guess what happened yesterday?

Just as TiFKAS was crowing about how Connectix had won a "decisive" victory over Sony regarding the VGS lawsuit, along comes Sony's army of humourless lawyers to rain on his parade:

From MacGamer's website:

Sony sues Connectix over patents (posted @ 02/16 4:30 pm EST):

After Connectix Corporation's recent victory over Sony Entertainment Corporation of America, Sony went to court again filing suit against Connectix alleging that the software company infringed upon eleven patents held by the consumer electronics mega-giant. In a report from MacGaming.com, Connectix CEO Roy McDonald is completely confident that the courts will not issue another preliminary injunction against the company like the one last year which prevented the company from selling or releasing updates for the Playstation emulator Virtual Game Station. This confidence comes even as Sony has requested that the same judge who issued the preliminary injunction last year hear this case as well.

<end of quote>

the article also goes on to say that Connectix is now selling off VGS on their website for $29.95 US, not quite a fire-sale price when compared to the $19.95 US you can get the same utility (which has fared poorly in the Mac market) from many Mac mailing dealers.

Remember about what I said about making sure the bear you shot was DEAD before you started posing for trophy shots next to it, TiFKAS? Well, the bear is still alive - and a bear with a flesh wound is going to be even more dangerous to the little nebbish who shot him.

Hark, I hear a "moof"! Is that Clarus the DogCow I hear - or is it the sound of TiFKAS with BOTH feet in his mouth?

Oh, yeah, in order to add Atari content to this post - Milan II is coming, and TiFKAS is very, very afraid - especially in light of all the new hardware and software coming out for the non-vapourware computer expected soon (I guess you've heard about the new Papyrus Office, which one of our TAF members is beta-testing at this moment and has been raving about being the ultimate Atari "killer app"). So afraid, that is, that in spreading FUD about Milan in a desperate and fuitle attempt to stop it he's managed to show how little he knows about the computer market - and that he has his blinders on regarding Apple's recent about-face in Europe......

He sent in the Army because Bourassa asked.
what is your problem? Quebecois ou Quebeckers are our countrymen because you say so, and they say so. By our countrymen are you referring to the english in Quebec? the native? the immigrants? the French? If the French, which ones? the sovereignists? the seperatists? the federalists? the pure laine? the recent immigrants?
Must be nice to live in a world with a population of one.

A premier is the first or 'prime' minister of the legislative assembly. same title,
slightly different meaning. Next you'll be saying that the Quebec legislative
assembly can't call themselves the "National Assembly."

$150 million in preferred stock is a large sum? Apple did not need it
since it had $2 billion and securities on hand(now over $5billion and
growing) The investment was to show the street and the public that
Apple is to stay..

In the states, an iMac 350 is $999. A well equipped PC would cost more.

sinclap!

Product subject to change.. Were talkink 1998 and beyond..Apple's track
record with releases is very good. While Milan II is struggling to
come out, Apple has moved on to other projects..

> .Rhapsody became Server X...Nice try..
>
> Rhapsody ws completely killed. Learn your histroy. Vapour....

Server X..

If MS had not decided to invest into Apple via cash injection and support
Apple would more than likely have folded. $2 Billion doesn't account for
much when sales are way down and Apple stores are closing all around the
place.

Looks like the Milan has alot of catching up to....

http://www.macwelt.com/action.lasso?-database=comnews.fp3&-layout=detail.lay&-response=detail.lasso&ser_nr=13&-search

Strong sales in the last quarter
Apple is clearly growing faster than its competitors. According to information which Macwelt received, International Data Corporation (IDC)
figured out, that the Apple Corporation in Germany can count on selling up to three times more computers than simply one year ago. While between
October and December of 1998 39,961 computers were sold, this number has climbed to 62,500 for the same time period in 1999. Sales in desktops computers rose from 36,401 to 48,126 and in laptops from 3,500 to 14,125. The latter figure indicates an increase of over 300 percent. IDC reports that Apple holds the eighth greatest market share of all computer manufacturers with amarket share of 3.3% (3% in terms of desktops and 5.4% in terms of laptops).

sinclap!

Hi all again. I've been observing all the entertainment and felt the need to post something again. I'm only 21 years old, and I'm sure most, if not all of you are older, smarter, wiser and better with computers than me, but I just wanted to offer something. My old man taught me not to worry
about what other people do in comparison to what you do....just get on, do good things. Let them be good, bad, intelligent, stupid, whatever. Everybody makes their own reward/punishment. Certain people (make that a certain person) is trying to inflame everybody else, with comments that have degenerated to schoolyard insults. Let's not sink to his level, eh? Don't dignify stupid statements with replies.

Sorry to come on all heavy.....lets talk ATARI, huh?

Lata,
Paul

I'm quite aware of that - but a Milan would need to be priced less than a comparable Mac !

> A $999 iMac with fourteen included apps is available today..No bargain
> here.

And there's no $999 Mac in Canader - even with manufacturer rebates !

At least, not in this area !

The Canadian Curmudgeon (in the land of the 65 cent dollar thanks to John Cretin)

No one cares about your silly name games: not the atarians
here and not the other PC users that would otherwise be using
consumer vidcards due to the fact that they can actually get
drivers for them.

Wanna compare Q3A timedemo scores?

>

So, people were capable of doing video editing on ST's and Amigas
in the 80's. Just because Apple tries to lead the masses to
something (this year), it doesn't necessarily mean they'll go for it.

Most of Apple's target end users are likely ignorant that you
could do such a thing with a consumer computer.

Yup, it's one of the fastest vidcards on the market today.
It's not the fastest, but Matrox has the reputation for
building the most GL compliant cards. Plus, this particular
model comes in a double headed configuration.

It will stomp all over anything ATI has.

Nope. When I posted that message I double checked. You see,
some of us do actually care about the details and about
actual facts. At that time, the price I quoted reflected
what was going on in the Apple store at that moment.

Although, even a $1000 price cut doesn't do Apple's 'high-end'
much good. It's still over priced.

No, quality just costs money. Sometimes it doesn't even
cost all that much, especially in electronics.

Dividends are just something to make you less competitive
in a cutthroat price sensitive market.

>

Once the FSF have managed to deal with all the little bits
in the Apple dev tools for OpenStep where they obfuscated
it, you shouldn't have any problems building Apple OpenStep
apps on any 030 or better Atari or Amiga actually...

Or, those Atari's could just run BSD directly and nevermind
the GNUstep cruft...

Yes I have actually. I didn't find it very impressive.
The would be local-corporate-mac-boosters also didn't
find it very inspiring either. It simply doesn't live
up to the hype and skewed benchmarks. It's a lightweight
when it comes to things that aren't user-input bound.

>
> So calling a VGS program a loser now that you lost..Have you ever used
> it? Can you get one for the vapour Milan?

no, becuase it LOST in SALES. That's why the major mail order stores
are selling them off at fire-sale prices.

YOU lost, TiFKAS, when you tried to compare a dog-selling program
like VGS to the highly successful DOOM. Caught with the meat in your
mouth!

Milan ain't vapour, and you know it, TiFKAS, no matter how loud you
screech.

>
> > >
> > > You sure?

> >
> > every time I go into the shops and compare both prices.
>
> Must be the high import duties..

what do high import duties have to do with the disparity between Mac
and PC game prices, in which Mac users pay through the nose for three
year old games when PC users can get them at reduced prices?

> >
> > You are TiFKAS. Now, pay attention as I explain it one more time:

when you make a promise, the people you promise it to expect you to
KEEP it - why do you think Bush was turfed out of office. Is THAT news
to you, or is that how you operate in the business world?

>
> > >
> > >
> > > You got it wrong. Did we not resolved this with mea culpa?

>
> What lying? Changing an opinion is not lying unless they changed the
> law up north..

you lied that "you never said it", and then you lied that I was
"making it all up". When I produced the evidence that you DID post it,

you ran from this newsgroup for a month with your tail between your
legs...

>
> > Now are you going to plead "no mas"?
> >
> > BTW, it's "Did we not resolve" Your diction is just as bad as your
> > spelling.....
>
> This is usenet...Changing the subject with 5 outs..

and as I said to you before, it's on topic. You claim to be an "Apple
Power Rep", yet your spelling and sentence construction reveal someone
that's obviously so stupid that you'd even flunk signing your name on
the resume. TiFKAS is the equivalent of that boneheaded hockey player
who's gonna be kicked out of the NHL....

>
> >
> > in other words, your word is completely untrustworthy. A warning to
> > anyone who deals with TiFKAS - Caveat Emptor.
>
> Your the one who is untrustworthly...You are a sore loser!

oh, really, TiFKAS? The fake "Apple Power Rep" who goes into a hissy
fit when one asks for evidence of his employment, who's been caught
lying and making up stuff about Atari from whole cloth, who can't even
spell (BTW, it's spelled "untrustworthy"), and who only posts to Atari
newsgroups in order to shore up his flaccid little ego because a number
of Atari users personally humiliated him in a public newsgroup? Look
who's the sore loser - hint, he's an idiot and he'll always be known as
Sinclap....

Look at that above sentence, and all the spelling mistakes - what
happened, TiFKAS, catch a brain virus from Roger Sheppard?

> > > Nope? Foul ball. Connectix beat Goliath...thats the issue ...
> >
> > Goliath just got up and smote Connectix with another lawsuit
> > regarding illegally copying 11 patents.
>
> Still won!

and you're still losing. Wanna clean the crap from your ears, which
resulted from having your head "up there"? Sony posted ANOTHER LAWSUIT
against Connectix a number of days ago. How could they have "won" a
lawsuit that hasn't come to court yet, KOOK?

>
> > The issue, of course, is that TiFKAS, the pretend "Apple Power Rep",

better pick up your needle, TiFKAS, the record is skipping....

> > Connectix has tanked with VGS, as a result of the lawsuits. Admit
> > it.
>
> Not here it has not..

it certainly has. Does your so-called "contract" require you to lie?
>
> >
> > uh, TiFKAS - do you ever read the news? According to the latest
> > polls
> > here, if a referendum vote was held in Quebec, it would be a solid "no"
> > vote against separation.
>
> In a rigged election of course..Just let them go and be happy!

we don't rig elections here, TiFKAS. And we certainly don't take
advice from know-nothing armchair pundits who've proven they don't know
SQUAT about politics, Canadian or otherwise. Even Bouchard isn't as
stupid as TiFKAS to hold a referendum where he'd get personally
slaughtered....

>
> > And talk about the pot calling the kettle black, when even your own
> > Republican Party is tearing itself apart with dirty tricks, running
> > mudslinging ads - when they're not doing it to the Democrats....

in the blue-skyed REAL world? Or do we get better coverage of the
elections on the CBC than your government will allow letting its people
know?
>
> > yep, draw my own conclusion - TiFKAS has run out of arguments, so he

TiFKAS - portrait of a whining little git who, beaten to a pulp by
logic, will crawl away insisting that he won. And, when caught with his
pants down and his hands in the till, sets him to new heights of
screeching in a vain attempt to drown out the logic.....

> > yardstick of "Vapour"....
>
> Vapour is when you hype it month after month..

that's your private interpretation, which nobody agrees with. Why did
a lot of Apple users vote the 500MHz G4 tower 1999's "Vaporware product
of the year"?

.Nice smokescreen to hide
> the fact that the Milan is vapour..

no smokescreen needed, since the Milan ain't vapour - to begin with,
companies don't develop peripherals for vapour products. Milan GmBH has
delivered on every one of their promises, and we all are looking forward
to Milan II when it's launched, unlike TiFKAS, to which the very
existence of the Milan undermines his one-man Jihad against everything
and anything Atari...

> > > somewere in Minnesota..
> >
> > hiding from the posse.....
>
> You?

no, YOU. I'm a good boy....

BTW, it's spelled "somewhere".....

how can we trust anyone who can't even spell "cheapskate?"

And look who's calling us "cheap" - the same guy who won't take a
crowbar to his wallet to pay for the wonderful iCAB. The guy who
allegedly takes handouts from his so-called "employer", rather than
applying cash towards the super-systems he preaches about to the already
converted?

Yep, an '060 in 2000 - shows you that the architecture is still valid.

And according to TiFKAS' yardsticks, a G4 is now "yester-decade technology". And trying to play catch-up to 850 MHz Athlons.....

yep, overpriced, underpowered iMac. No bargain here.

where can we find a fully loaded blueberry iMac in Canada for $999 CDN, TiFKAS? Or for what it should REALLY be worth, which should be $599 CDN.

BZZT! Wrong! Apple later told CNet that they had every intention of
releasing a 500 MHz G4 tower in the near future. If Apple told a trusted
media source this, whether there was a press release or not, it still
makes it official.

ah, poor widdle sincwap - too afwaid to get his hands dirty, would
wahther wet his mummy do aw his configuwing fah him whateher than tax
his widdle bwain (mummy told him that there are icky germs that might
get inside him the next time he picks his nose....)

Gee, TiFKAS, the Voodoo 3 drivers for the Mac are beta, use at your
own risk - does this also make them useless?

>
> > >
> > >With well written GEM software a nice piece of video-editing could be
> > >achieved...
>
> Too little to late..iMovie with iMac DV have beaten to the punch..

unfortunately, thanks to Apple being too stupid to make sure that DV
actually WORKED before they shipped, users are seeing just how bad it is.

Oh, and did we mention that iMovie doesn't run on a 64 meg iMac,
unless you turn on virtual memory (too slow) or cough up cash for more
memory (Ka-CHING!).

Compare this to Mountain, that runs on a 14-meg Falcon with rooms to
spare and has gotten many kind words and amazing reactions.

TiFKAS should only be concerned with the "punch" that has broken his
virtual glass jaw over and over and over.....

For $999 I'd expect the technology to be a bit less past it's use-by date.

Does it have a 50 speed CD-ROM?.
DVD drive?.
At least a 8Gb HDD?.
At least 64Mb RAM?.
Decent 3d accellerator?.
A floppy drive?. (I find a floppy drive handy, so it does matter to me)
PIII 500+ Mhz?.

iMac 350 well equipped... pigs arse!.

ah, making up stories again, eh? I can show you a lot of places in
Canada where you can wipe dust off the package.

The only "killing" going on is Connectix' hopes of having any
profitability on VGS, especially after paying all those attorney
bills....

>
> > YOU lost, TiFKAS, when you tried to compare a dog-selling program
> > like VGS to the highly successful DOOM. Caught with the meat in your

hmmm - VGS is out for a year, dies a dog's death in the market and
Mac dealers have to try to unload them at fire-sale prices. Compared to
DOOM, which has been out since 1993, has made millions of dollars in
sales and is still supported. Anyone who tries to compares these two
products obviously has been too long at the Jack Daniels.

The hardware business (which like everything you try to comment on,
only shows your vast ignorance and reveals you have the IQ of a snail
fork) certainly has product life cycles as well. But at least I know how
to spell "stale", which you won't or can't.

>
> > Milan ain't vapour, and you know it, TiFKAS, no matter how loud you
> > screech.
>
> Can I buy one today after months of hype?

why would you WANT to, TiFKAS? Want to destroy it with a sledgehammer?

Milan II comes out March 4th at a trade show in France. You can
certainly buy an original Milan from Milan GmBH, nobody is stopping you
from doing so....

And you should know "hype", like Apple claiming that iMacs toast
Pentiums (but only using flawed benchmarks, real world benchmarks are a
whole 'nother story....)
>
> > >

> > year old games when PC users can get them at reduced prices?
>
> not in the States here..To you...down south...

once again, TiFKAS, dodging the issue. Mac games are well-known to
cost several times more than their PC counterparts, and usually one to
two years AFTER the PCers get them first, on either side of the border.

the infamous New Zealander who was also a brain-dead troll like
yourself - and like you, couldn't spell. And like you, had that horrible
habit of putting his foot in his mouth - like calling Australians a
racist term that got his ISP account terminated. IIRC, you were the only
one who defended him, claiming free speech....

I understand though that Roger's popped up again in New Zealand, and
it appears that the incident has helped him to clean up his act. Just
like you could, if you'd only go back to Bellevue and allow the doctors
to use a defibrulator on your head....

we don't mind you calling Harris "Newt" - after all, Newt Gingrinch
is noted for also being a liar, a crybaby, a man who doesn't honour his
wife and a sore loser. And Harris and his narrow minded cronies are
going to be turfed out next election, just like Newt....

Depends on who compiles/adapts the software dickwad! There are many fine softwares that come from free source...probably more than one or two bits of the new Mac OS X are stolen from unix source in order to stabilise it more...

> > >With well written GEM software a nice piece of video-editing could be

How can two companies that tread totally different pathways lead OR
follow each other? If Milan were a follower they would create machines
that use Mac OS, only Apple wouldn't let them. Thank goodness Milan
have NOT chosen that particular direction...

> Sounds like Custer's last stand...

Custer deserved his fate...he raped, pillaged, and generally was a
naughty boy. That certainly DOES NOT sound like Milan and the ethics
behind Milan. That to me is more like Bill Gates. Stevie Jobs is
playing catch-up, but he has some ground to cover yet in his quest
to be a 'trendy' Bill Gates...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

I don't think it really worries any of us, least not myself. We're happy knowing that the childish exploits of a certain frequenter of this NG do nothing but prove his lack of sound logic.

> Sorry to come on all heavy.....lets talk ATARI, huh?

We sorta have been though. Thats the whole point. We have news of Milan 060 computers that are inches away from market, and Sinplop simply has to put his 10c worth in. He refuses to identify himself plainly in front of the rest of us, and his claims are baseless simply because Milan and Apple are treading different pathways.

I think the only reason I bother replying to sinplop is that I enjoy watching this guy sacrifice himself in front of a NG inhabited by some well together individuals, most of whom are fans of Atari computers!

I do find it amusing, and because it IS a .advocacy NG anything really goes...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

4957. Atari Today - New UK Atari Magazine - Free Advert Offer

Newsgroup: comp.sys.atari.advocacy
Date: 2000-02-25 00:00:00 UTC
From: TechSoftware <BobF@techsoftware.demon.co.uk>
Message-ID: <dreibel-C821D0.08521325022000@bigmomma.idirect.com>
Source record: 2072

Something of interest to all Atari users....

Atari Today

More good news on the magazine front. Atari Today will
be launched in March. This is a new A4 style magazine
which includes articles from Atari developers, users
as well as a round up of news, reviews and general interest
articles on the Atari scene.

Each issue costs 2.50 UK Pounds and includes a cover disk.

If you are a supplier of Atari hardware or software you
can place a quarter or half page advertisement FREE in
the first issue. We have a limited amount of space and
it is let on a first come first served basis. Advertisements
must be sent as a 300 or 600 dpi GIF file. This is the
only format we accept for free advertisements.

Quarter Page is 90 x 130 mm
Half Page is 180 x 130 mm

You can also place 1 FREE classified advert in the magazine.
Send up to 50 words in ASCII text format. Again space is
limited, so first come first served!

We have a great first issue, with games reviews, programming
features, accelerator news, and more. Should be available
mid March.

Bob Frost
Editor/Atari Today

4958. New ST Applications

Newsgroup: comp.sys.atari.advocacy
Date: 2000-02-25 00:00:00 UTC
From: stclub@cix.compulink.co.uk
Message-ID: <dreibel-CC1169.08562525022000@bigmomma.idirect.com>
Source record: 2073

News of the new A4 edition of ST Applications follows - please distribute widely! The next issue is complete - just waiting for advertising copy and confirmations.

We published our first Atari magazine, The ST Club Newsletter, in the Spring of 1986 - and we're still going strong. Full of invaluable information, ST Applications is an essential read for all Atari users who want to get the best out of their Atari software.

Supported by articles from contributors to Atari Computing the new-look ST Applications ensures that Atari enthusiast will have a printed magazine during the year 2000 and beyond. Issue 78 of ST Applications will herald a return to an A4 magazine-style format with lots of new features and a regular printing schedule. Existing subscribers to ST Applications will get the new-look magazine as the next issue of their subscription.

Inside each issue:
• News - the latest Atari News from around the world.
• Reviews and Articles - new products reviewed and 'how to' articles that help you to get the best from your Atari hardware and software.
• Atari Online - our unique guide to the Atari online world.
• PD and Shareware Updates - the latest Atari software news.
• Forum - help, news, views and letters.
• Classified Adverts - buy, sell and swap hard to find Atari gear. Adverts are free to subscribers.
• Contacts - User Groups, Meetings, Shows, and appeals for help.
• Emulators and Clones - keeping your Atari software alive without any Atari hardware!

Keeping the Atari market alive:
4+ issues a year - New A4 magazine format
Free classified advertising for subscribers
Advertising and publicity for Atari suppliers worldwide
Publishing in: February, April, July, October and December 2000.
Single issue: £3.50, 4-issue subscription: £12.
(Overseas rates and distribution: please email us for latest details.)

"I first contributed articles to ST Applications way back when it was a newsletter and for years it remained my favourite Atari magazine. ST Applications has always been written by enthusiasts for enthusiasts - long before we penned that phrase to promote Atari Computing. Although ST Applications never ceased publication, in recent years it was a shadow of its former self. So I'm absolutely delighted that FaST Club

have decided to re-launch ST Applications in a format which gives it a chance to recapture those halcyon days and, more importantly, those ex-Atari Computing readers looking for something to read! For the first time in years, I'm looking forward to reading something I haven't already edited and also look forward to contributing articles to ST Applications. I wish everyone involved the very best of luck." Joe Connor, Atari Computing

Apple is centralizing all Marketing efforts at their Paris HQ to cut
duplicated costs, be efficient and have a consistent marketing message.
They want all in Europe to be on the same page.. This will free up
money for more marketing/sales activities..

Have you seen the sales figures Apple has released? The iMac DV SE
according to Apple has much better than expected and that many are
buying for iMovie!

The Amiga and ST had archane video setups that really never took off...

The question is...what are they doing today?

Bzz... Therefore, the iMac is crap since it uses ATI components.

Of course it is. You think I didn't know that already? My point is that
fine software exists for ALL platforms...irrespective of how 'current'
the platform may be. Its all in the coding...

> Mac X will be awesome when its released this summer. No point in
> planning r/r this summer..

It looks to be a better networking solution than current MacOS
offerings. Unix underpinnings would always be useful in the
code to offer better stability...

> So what would be the point in trying and bothering about it? What is
> the point of the Milan and Milan II?

I'm not sure this even warrants answering. If you cannot see why Milan
i/ii are being made then there is little hope for you. A newer, faster
Atari compatible, using current 'innovations' like USB, SDRAM etc...is
the goal. A machine that runs current Atari software at much higher speed,
higher colours and so forth. A key issue is the use of current peripheral

standards like PCI/USB ports. That gives this new 'Atari' openings to a larger/cheaper marketplace for technologies such as Digital Video. I'm afraid if you cannot understand the strategy behind that then you should never have been employed as a rep for Apple...if indeed you ARE an Apple rep.

If you want to silence the critics, give us indelible PROOF of your claim to employment...

certainly - try over at http://www.icab.de . There you'll find iCab
in a variety of languages, in both PPC and 68K form (another advantage,
iCAB supports older Macs including older PowerBooks - no wonder TiFKAS
has been running a disinformation campaign against it!), and even some
replacement icons for use with it.

Yep, Alexander Clauss brought the best of what he did for the
original CAB and made it even better.

4990. Don Crabb 1945-2000

sinclap's 21 gun salute to the renouned Apple author and critic..

macintouch.com

We lost a colleague and a valued member of the Mac
community on February 26, 2000, when Don Crabb passed away. Don had a
remarkably quick wit, a wonderful sense of humor and a
real love for the Mac (Apple's foibles notwithstanding). He somehow
managed to
singlehandedly produce more Mac and computer content than
any five other writers, while simultaneously teaching and consulting
and
communicating with all kinds of people about shared
interests. We're going to miss him.

Don's web site at www.doncrabb.com has his bios, written
in classic Don Crabb style, and a few photos. Roger Ebert wrote the
obituary
for the Chicago Sun-Times, and WGN Radio notes the
funeral arrangements.

Memories of Don Crabb

from Rich Coulombre

If memory serves me correctly, I first met Don Crabb in
1992 or 1993. Claris Corporation had arranged for a FileMaker Pro 2.0
demonstration on MacTV with Don Crabb as host. This was
to be my first experience in front of a TV camera, and I was quite
nervous.
When my wife and I arrived for taping, the show's
producer introduced us to Don. His demeanor immediately put me at ease.
We actually
hit it off quite well. In fact, you'll find a lot of
people who found it very easy to like Don. For someone with his
enormous popularity and
exposure, he carried no airs or attitudes.

During that day we taped about 6 episodes, a record of
sorts I'm told. Don seemed to have boundless energy. In fact, at lunch
that day, I
was amazed at his ability to multi-task - he ate lunch,
carried on a continuous conversation, and wrote a column for one of his
endless list of
writing assignments.

While in New Hampshire, we stayed at an old bed and
breakfast recommended by the MacTV folks. While we were there, the
lights went
out several times during the night. When asked the next
morning about the power outages, the exasperated owner talked about
that computer
guy who had brought so much computer gear into the bed
and breakfast; the owner was not only concerned about the fuses that
kept
blowing, he was afraid that he would burn the place down!
Yes, it was Don at work.

Shortly after these tapings, my first FileMaker Pro book
hit the streets, and I received several phone calls from readers
indicating that they
had bought the book based upon Don's recommendation in
his column in one of the many Macintosh publications for which he
wrote. Don
had received a notice about the book, and took it upon
himself to help out this fledgling author. He was a true gentleman.

On several occasions Don asked me to participate on
panels at MacWorld. One of these panels was called "Don Crabb and Bob
LeVitus
Unleased". I was the so-called "moderator". What a
humbling experience! With the incredible wit and humor of both of these
speakers, I
just sat back and watched a couple of pros go at it. Don
was really at home in front of an audience, with an incredible ability
to talk on
deeply technical issues at one moment, and handle the
most difficult of public speaking conundrums at the next. In fact, if
memory serves
me correctly, Don showed up a few minutes late for the
panel. When he arrived, he came charging down the middle aisle
chanting, "I'm
here!". The crowd exploded into wild applause. And God
forbid the hapless audience member who challenged him. He would chew
them
up and spit them out in a heartbeat. The man was that
good.

Over the next few years Don and I would communicate via
email from time to time, and would work together on panels at MacWorld.
It
always amazed me when I would get an email from him at 2
or 3 AM. One night, my phone rang at 1 AM (Boston time) and it was Don.
When I mentioned to him that is was 1 AM in Boston, he
replied that is was only midnight in Chicago. I don't think the man
ever slept.

When MacWorld was held in Boston, we held a party at our home that Don regularly attended. It was like the king and his court. Don was a charismatic fellow, and very approachable, and his disciples would gather around to discuss any number of computer-related topics. But he was also a very funny man. He had done some stand-up comedy in has varied career, and it showed. I remember him "getting on a roll" several times, where we sat there with tears running down our faces from this outrageously funny man.

It was at one of these parties that Don announced the formation of the CAB (Customer Advisory Board) that Apple had asked him to organize. Many of us remember him as an outspoken critic of Apple. In some of their less profitable days, Gil Amelio and Marco Landi had asked Don to put together a group of people to meet with the exec staff at Apple on a regular basis to discuss some of these criticisms. The purpose was to provide feedback to Apple on current and future business plans. Don asked if I would like to participate.

During our first meeting, we met with folks such as Gil Amelio, John Floissand, Marco Landi, and Ellen Hancock, among others. These were folks that I had only read about before, and now, due to Don's influence and friendship, I was sitting among them. What an incredible experience! By the second meeting, Steve Jobs was back, and the entire exec staff had been replaced. As a private joke, we always told Don that it was his influence that caused this mass exodus of the exec staff. It really was no joke, however, how powerful a figure Don was inside the Macintosh community.

Don will be sorely missed in the Macintosh world. It was a world that he cherished. All of his criticisms had one objective - to make the Macintosh a better computing platform. Don was sometimes referred to as a curmudgeon - but he was our curmudgeon - someone who called it like he saw it. Many loyal readers followed his words. He will be deeply missed by those who only knew him through his words, and by those who had the privilege to know him personally.

There was an article in Sunday's NY Times in regard to the growing CA tax cheats who are fed up with the high taxes and the poor governement services. Seems that the folks like ones in the escort business wants to be paid under the table in cash, that many MBA students who attend down south never return and etc...What gives? Also Mike 'Newt' Harris was re-elected last May despite Chunk's asertion that he is going down..

Since always. ATI is always at the bottom of the video
heap. The fact they accelerate iDCT in hardware is
somewhat interesting but their cards are in general, crap.

Until you can product actual numbers, no one here has
been outflanked. The one benefit of a Quake benchmark
above most others as it tends to be relevant to what
many people actually use their machines for.

A lot more people run Quake III versus Photoshop or some
obscure video authoring tool.

The fact remains that 'amateur hacks' are more than
capable of keeping up with demanding consumer
applications. The Quakes are a good example of that.

No, it will be just another Unix implemented on top of Mach
with OpenStep on top. It will just be NeXT recycled. Except
now it will only run on one platform (oh joy).

We're talking someone else's 10 year old tech here.

Both are marginal, overpriced platforms. The differences
you percieve really aren't there. Just about any criticism
that you can level at the Milan can be turned back around
against your Macs.

By the time the V5 comes out, whatever Nvidia or Matrox bring
to market will likely beat it. The Voodoo's are good FPS cards
but they're weak in other areas.

Although, the performance gap likely won't be as wide between
Matrox and 3dfx as it will be between Matrox and ATI.

It's still OEM generica that tends to only get on customers
machines because it was forced onto them like a winmodem.

Hardly. It isn't a pervasive standard. It's proprietary.
Thus you either to hope you're lucky enough that your
recipient will be able to deal the media or the drive
itself.

A CD burner would be much more useful and would actually
be quite appropriate on a 'progressive media machine'.

Too bad Apple is really a bunch of posers...

[rubbish deleted]

We know a lowend bargain basement free-PC with the
x86 replaced with a PPC when we see one.

Operating capital != dividends.

The current market frenzy isn't being driven by dividends but
by potential future worth. For once americans are actually
managing to think past tomorrow and realize that sometimes a
company can't afford to spread around the money that it could
put to better use re-investing in the company.

Java can crash any browser. This is no great black mark
against Netscape. It's just the state of things.

Except since a few versions, Java cannot be disabled completely.
There used to be an "on/off switch" in the preferences.

You can't be that dum? Since Apple has their financial order in house
they have begun to tackle long term issues beginning with the tech
support lines improving Apple Care and reorganizing their Worldwide
operations. My mom sent me a iMac advertisement insert from Germany
which was the same as the U.S. one except for the German lanaguage.
Looks like all are on the same page and that separate area country
marketing teams are not needed.

Apple Germany posted 100+ unit sales in Q1 2000 over Q1 99..Thats a
fact..You know it.

Want to strike out again?

They work...But the makers of the Voodoo 5 will support the mac
platform this time seeing a growing market.

In your wildest dreams..At the MacWorld/SF, the top midi folks were
there with nice USB and firewire solutions. I asked one if they will
continue to develop for the ST/Tos line. His response was..Did Atari
make computers...ah I thoughty they made video games..Are they still in
business?

A few versions? NS is in version 4.71 and the Win32 version
of NS 4.6 still has the 'switch' as does the Linux version
of 4.61.

The win32 version is currently underfeatured, compared to any
other version. Not only is the java switch gone, but the number
of character-sets supported are quite fewer.

Btw, the java switch has been gone since longer than this.

HELLLLLOOOOOO? ANYBODY HOME??!!!

None are sold anymore because:

a) they don't need upgrading - it works, don't fix it.
b) Atari _corp_ has been out of the market since 1994
c) once properly configured, Ataris keep on working.

By people who return their Mac/PC to the dealer less than one
week after buying it. Then, they look for another ST again.

> You have nothing to upgrade to..

The reason why people need to constantly upgrade on Mac or PC is
because those are already obsolete by the time they are released.

An ST never needs upgrading; it still does the job.

Funny, it's still there in my copy.

As far as being 'underfeatured' that's more you buying into
the Windows Bloatware mentality than anything else. All the
hellspawn of Mosaic need to be taken out back and shot.

I'll be really glad when the Linux version of Opera gets
out of alpha. It's performance is so much better than
either NS or IE that it's almost surreal.

too true! :-(
I just got my CenTurbo2 back from Rodolphe, and have just installed 64MB
RAM.
g*d what a difference! :-)
nice and fast, faST, FAST. 5 times faster than a TT!, 10 times over a
ST.
I am testing out caches also. between Cecile<->HDdriver<->Tcache
I am impressed by Cecile btw.
now I just have an few compatibility issues to sort out. :-)

No, it's not. I need something that supports iso-8859-15, but
only the Linux version of Netscape supports it. Disabling image
display or Java? Linux! The Windooze version enables everything
in a very fascist way and expects you to enjoy it.

Yes, a great entry level computer before they upgrade to a PC.

(With a realistic price/performance ratio, faster and larger storage devices
and decent 3d performance, and a huge software library most of which is
available at a local outlet, no matter where you live).

nope - check out Mac advocacy, lots of complaints about Netscape
crashing, bloated, buggy....

>
> > Many Mac users are using iCAB and are praising it highly, and
> > completely disagree with you.
>
> Many would disagree with them as well..Whats your point?

what about MacAddict? They did a review of iCAB and they loved it for
the very reason many Mac users love it - better HTML handling, no code
bloat. They said they were amazed that it did so much for what was
little space requirements....

>
> > >

can't spell "Where"?

it's called mail order, TiFKAS - and you can get it via Systems For
Tomorrow or Chro-Magic in Missouri.

Of course, your wanting a copy of MagiC is superfluous. Or are you
planning to buy all of Kent Kordes' copies of it and burn them all in a
huge bonfire? (Don't worry, he'll order more :))

> He he he..Motorola will make money producing 50 Milans a month?

we already know from Milan GmBH's record so far that they were
producing at capacity when they were selling 50 Milans a month, and that
they were back-ordered. Having Motorola behind them to help build the
new Milan USBs will eliminate that problem. Motorola believing in the
project obviously is an advantage that this is not a joke computer
system...

of course, TiFKAS is so syncophantic to Steve Jobs that he'll
believe anything he says without questioning such nonsense. Why, I bet
that if Steve Jobs told a MacWorld audience that cat feces tasted like
ice cream, TiFKAS would be the first one at the litterbox brandishing a
spoon. :)

can't even spell "Not", TiFKAS?

oh yeah? here's what one pro has to say about this:

Subject: Re: Aqua screenshots from Mac OS X DP3
Date: Wed, 23 Feb 2000 01:09:45 -0600
From: "Raist3d" <raist3d@mcs.net>
To: "Liberty for ALL!" <liberty4all@mediaone.net>

The problem is not the OS, atlhough I certainly would like to use daily apps to see how the performance has improved over Mac OS. The problem is that the G4 at its top speed is much slower than the AMD Athlon chip at its current speed. It requires about 100-150Mhz more of speed for an Athlon to match a G4 in FPU and the current G4's top speed is 450Mhz while Athlon is already going at 850Mhz.

Also the Athlon has a fairly strong FPU unit- the Athlon is actually toasting the fastest Intel coppermine chips at the same speed for 3d graphics rendering (about 30-36% faster at the same Mhz). On normal apps, they are about the same.

While the G4 has the Altivec instructions, the Altivec do not lend themselves well to everything, and for a 3d application require some serious recompiling/manual optimization that in pragmatic terms is very hard to do, for reaching its optimum potential.

For sure Mac OS X will kick ass being NeXSTEP in disguise. I wonder what Apple will do for upgrading the speed of their computers. For many tasks (word processing/etc) they are fine but for 3d graphics rendering they are behind (not to mention extremely overpriced). Also in realtime graphics they are about 2 generations of graphic boards behind the PC now. When Nvidia comes out with Nv15 based boards on the PC that would be 3 generations back. (I know 3dfx is coming with the voodoo4/5's to the Macs, but the NV15 from Nvidia will be most likely better).

Anyway, I have thought about switching to the Mac because of the new OS, and because mostly of what I use on the PC is "dual platform". But I can't put away the fact that rendering would be much faster in an Athlon and that's one of the things I am doing the most.

- Raist

> Looks like all are on the same page and that separate area country

> marketing teams are not needed.

what I know is that when companies start laying off workers even when they're supposedly making big profits, something must be terribly wrong somewhere in the bean-counting areas. And when companies start consolidating into out-of-country support areas, we expect to see some major long-term problems with getting proper support from them.

We know something's wrong when Apple suddenly drops all British OS support from OS9, and an executive at Apple admits to MacWorld UK that it was done as a cost-cutting measure. Jobs' bone-headed handling of Apple UK (from pulling out and then later causing the cancellation of a major UK show, to firing the UK's marketing department, and now alienating UK users by forcing them to use an American-language OS) is certainly giving a lot of consumer confidence...

Maybe Apple could have saved many jobs if they hadn't decided to give Steve Jobs that jet. Oh, and speaking of which, what is that story I'm hearing that Apple didn't properly declare the jet, thereby meaning that Apple really only cleared an 80 million dollar profit last quarter?

>
> Apple Germany posted 100+ unit sales in Q1 2000 over Q1 99..Thats a

to begin with, it's spelled "where".

But many keep the big promises - and one big promise was kept Monday
with the federal budget. We got major tax cuts, AS PROMISED.

Of course, we won't mention too much about the other type of lie -
like Clinton lying about Monica :)

funny, I thought Mike Harris was his own "albatross".

it was wonderful seeing Harris whine that his government didn't get
any transfer payments for health care. Perhaps Chretien was concerned
that he'd use the money for more tax cuts for his rich masters rather
than health care. Even Homer Simpson knew what to do when the choice was
"keg of beer" and "Lisa needs braces".....

> > oh, BTW, TiFKAS - McCain wiped the floor with George "Wimp Jr."

iCab and Opera both proved that compact, efficient coding beats
the crap out of commercial bloatware. Fat features do not ever
require fat hardware, only efficient coding.

They also proved without a doubt that you don't need to "upgrade"
in 100 MHz steps every 6 months, just because of poor programming
skills in Redmond.

> > The iMac 350 comes with 14 high quality apps that
> > the Milan could not compare to. Nice try at spin.

The Milan already includes a true who's who of Atari products and
more is coming, now that Milan has HP and Motorola's backing.

Who are you trying to kid? I disable both of those on a
regular basis quite easily in the win32 version.

>in a very fascist way and expects you to enjoy it.

Netscape for Linux supports iso-8859-15; not the win32 version.
Fact.

Proove it.

On Win32, you can only disable Java/Javascript on a site-by-site
basis. The Linux version has specific menu options to handle it.
Same for iso-8859-15 support.

Hmmm - does that also apply to Canadian Banks then, m'dear Dan - which despite massive profits keep 'downsizing' their staffs and 'rationalising' their Branches !!!!

The Canadian Curmudgeon (in ever sunny, Calgary)

It's the same menu structure as the Linux version actually.

It's right there on the Preferences->Advanced tab.

Infact, Netscape added another option in later versions (rather
than removing them) so you can disable javascript in mail &
news (a recently discovered security problem).

Look at <URL: http://www.my-ste.demon.co.uk/images/netscape.jpg>. That's
the preferences dialog for Netscape 4.7 on Windows 98. As you can see, I
normally use Netscape with images turned on, but with both Javascript
and Java turned off. If I find I need Java or Javascript I turn it on
and reload the page.

>On Win32, you can only disable Java/Javascript on a site-by-site

Not true, as you can see from the above.

Read it and weap!

Wednesday March 1 3:13 PM ET

Apple Shares Surge After Analyst Comments

SAN FRANCISCO (Reuters) - Shares of Apple Computer Inc. (NasdaqNM:AAPL - news) jumped in active trading after a Donaldson Lufkin Jenrette analyst made
positive comments about the PC maker, saying it is poised for a strong March quarter.

Kevin McCarthy, an analyst with Donaldson Lufkin & Jenrette, said in a note to clients that he is currently maintaining his estimates of $0.78 a share for its fiscal
second quarter ending in March, but that there is a possibility for some upside.

``At this time, we are maintaining our FQ2 estimates of $0.78 a share, $1.95 billion in revenue, and 1.05 billion (unit) shipments, but Apple is poised for a strong
March and we see the new products driving upside to our estimates,'' McCarthy wrote.

Shares of the Cupertino, Calif.-based company surged 12 3/8 to 127 in active trade, another new high for the resurgent computer maker. It earlier reached as high as 130
3/4 on Nasdaq, well above its year high of 121 1/2. It gained 1 3/8 Tuesday to 114 5/8.

McCarthy noted that his checks with retailers indicate that the batch of new products introduced at Tokyo MacWorld in mid February are selling ``briskly,'' which he
said Apple confirmed.

Sales of Apple's PowerBook professional notebook line are on track to exceed last quarter's sales, after a much-needed product refresh was introduced in Tokyo. The
company's new high-end graphite-colored iBook is rejuvenating sales of the iBook family, which McCarthy said were soft in the month of January.

He also said that the new PowerMac G4 professional desktop, with a new performance upgrade to a 500 megahertz G4 PowerPC processor, is ``flying off the
shelves.''

Sales of subscriptions to EarthLink Network Inc.'s (NasdaqNM:ELNK - news) Internet service to Apple customers are tracking ahead of plan, McCarthy said.

``We believe there is significant upside to the original estimate of $25-$35 million in calendar year 2000 net margin dollars deriving from the EarthLink alliance
announced in January,'' McCarthy said.

McCarthy was traveling and not immediately available for further comment. Officials at Apple were also not available .

Found the Java one, but there is no image on/off; only a "load
images automatically" option.

Atari Underground update for March 2nd 2000

The wait is over !!!
****
SCATOLOGIC RELEASES THE LONG AWAITED BATTLESPHERE(tm) FOR JAGUAR AND DONATES
ALL PROFITS TO DIABETES RESEARCH

February 29, 2000

For immediate release:

CAPITOLA, CA -- Scatologic Inc. is pleased to announce that the long awaited BattleSphere(tm) for the Atari Jaguar platform will soon ship, and that all profits from the game will be donated to diabetes research.

BattleSphere(tm) is the awesome full 3D networked action shooter for the Atari Jaguar. The game was developed by renowned Jaguar, NUON, PSX2 and PC developer 4Play, which recently merged with Scatologic Inc. to form the newest industry powerhouse development team.

The highly anticipated BattleSphere(tm) combines the fast-action gameplay of a first person shooter with the nonlinear aspects of a strategic campaign simulator. Also included on the same cartridge are several additional play variations which range from a pure classic arcade action game to a multi-player networked deathmatch mode, where up to 32 players can dogfight for control of the Universe. The game garnered acclaim from players when it was demonstrated at the World Of Atari show in 1998, and it has received glowing praise from industry leading publications like Next Generation Magazine and Diehard Gamefan magazine.

BattleSphere(tm) was completed several years ago, but the release has been pending for some time due to the fact that the Jaguar ceased to be a mainstream platform, and the software, tooling, and procedures required to produce cartridges were lost and had to be recreated. "The biggest hurdle was overcoming the loss of the software encryption key." said Scatlogic COO, Douglas Engel, who was one of the original

BattleSphere(tm) development team. Scott LeGrand, Scatologic CEO, was enthusiastic about the team's effort to recreate the missing encryption key. He commented, "Generating a unique key ourselves allowed us to produce the highest quality game, cartridge, and packaging without resorting to risky unproven and expensive hardware bypassing techniques."

In an unprecedented move, Scatologic has announced that all profits from the sale of BattleSphere(tm) will be donated to diabetes research. Scatologic CTO Stephanie Wukovitz stated, "Videogames are stereotyped as a harmful influence on society, and we wanted to show that they can be a very positive factor. Donating the profits to diabetes research is our way of showing this, as well as a way to thank everyone who has helped us get this game produced."

A special autographed copy of BattleSphere(tm) is up for auction on EBay right now. As an added incentive, the high bidder's name will be digitally encoded into this very special collector's item. BattleSphere(tm) will begin full-scale shipping soon afterwards. BattleSphere(tm) is priced at only $74.99 plus $5.00 shipping and handling (Continental U.S.). Orders outside the continental U.S. will require additional charges depending on the destination. California residents must add 8.25% sales tax.

Have you been using Netscrape since just yesterday or
something? THAT is the 'images off' switch. After you
toggle it you get a new task bar button that allows
you to manually trigger image loading for a particular
document. Otherwise, images are 'off'.

No, it is not. On the Linux version, you can litterally toggle
images back and forth, on an already loaded page. Just like in
CAB. Not so on the Win32 version.

Once you've cached the images, what's the point?

Once the images are local to your machine, there's
really no good reason to deprive yourself anymore.

Hopefully its very own direction. A direction that keeps fans of the
Atari TOS platform happy. Some following of mainline trends is of
course necessary to prevent the platform from outpricing itself
from the 'competition', ie using PCI graphics cards or SB64 sound
cards in the case of the Milan II...

Outside of America we learnt how he went about his business. It did
not come across to me as a particularly nice approach...

> I like that...A trendy Bill Gates...

Its becoming more obvious to me that, while world domination is not
Jobs' goal, a much larger piece of pie is higher on the priority
list than a pie that tastes better...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

Clearly didn't ask anyone this question, especially if midi was involved.
This is why you are known as an IDIOT. Only two of the statements could
possibly been said.

1) Did Atari Make Computers (meaning, we don't develop for computers no
longer manufactured)

2) Are they still in business (meaning, we only want to support what is
out there, and being sold) ITS MAC WORLD YOU IDIOT!!! What other answer
is for them to give. They are at the show to promote products for Apple
computer. Not talk about software that they don't make for a computer
that performs better than anything currently on the market with regard to
midi.

3) Anyone with a clue and develops midi products, knows what an Atari ST is and the midi capabilities it has. If they don't they shouldn't be in the business. Regardless of whom they are developing products for.

My local music store sells Mac and PC software/hardware and runs their own private studio on Ataris. Their concern is with regard to when the computers may break, but finding parts is easy as there are many used Ataris around if you are looking.

Now I picked up on a thread from someone whom seems to have made his first post on the tech thread. I have never seen or heard of him before. so for your benefit, I will help you become eductated. If you truly want to look like an idiot, more than you do here, or on a Mac NG, I suggest you go to any music forem, and start preaching your mac, and belittling the Atari. Here in advocacy, the people are pretty good and just toy with you, because we like having a village idiot around. I don't believe you would be so welcome with all the knowledge you pretend to possess with regard to midi.

>you..but I wouldn't step on stage with anything else!
>happy motoring,

This is true. When doing MIDI the Atari is not doing anything. It is a
small
and simple system. When doing sequencing, a PC or a Mac is always
multitasking, checking IRQs, leaving precious CPU cycles to screensavers,
sound card drivers, virtual RAM swapping, anti-virus stuff, let alone a
soft

synth, hence the appalling real-time performance.

I started making music with my ST, worked great but for some resason I changed to PC, everything f*cked up, never worked, the music did not play "tight" especially when I used audiotracks with midi. So I changed back to
my F030. The timing is a lot better, even when you use midi + 8-16 tracks audio. I think the timingproblems on the PC is not due to the PC itself, rather the OS.. Also - cubase on the PC has a lot more bugs, and crashes randomly. Quite a turn-off. But at least it is pretty to look at :-) (nice
colors)

You wanna debate any of the above arguments, bring an expert.

Later Brian.

5051. TiFKAS Knows SQUAT about Atari MIDI, was Some thoughts on why we're here...

Bravo, Brian, Bravo! <virtual clapping>

of course, this means that TiFKAS now considers you Public Enemy No. 1 and will do everything in his power to try to smear and discredit you while trying to dodge the issues :)

Oh, since we're on the subject of MIDI, thought I'd drop this message from a real live professional Atari musician:

hello All:

I am happy to announce that GVOX has given me permission to have the Atari version of MASTER TRACKS PRO ver 3.6 as a free download on my site. All it took was emailing them with a request. A few weeks later, they sent me with a reply and an Attached licence agreement to release MTPRo at my site for Atari Users only. So I scrambled, made the page and wrote up a Tutorial, and it is now there.. WHEW!

Also, I was trying to convince Dr T (Emile Tobenfeld) to release Omega, But he said to go ahead and have the REAL version of TIGER CUB on my page. So I scrabled again, and it is there also. This is NOT the demo version that is available on most Atari FTP sites. This is the "real" version, and it's great! Also he said that OMEGA II is Still available from him, so that Info is on the page as well.

BTW..M and RealTime has also been released as freeware, and is at my site as well. Guess it's my mission in life to make OUR Atari midi apps into freeware. It's takes time and work, but you can be succesfull!

Atari was made for Midi! (or is it Midi was made for Atari!)

Anyway:

here is my site

http://atari.atlantis-bbs.com
Tim's Atari midi World

Tim Conrardy

Just think - some proven MIDI software for Ataris are now available free. Just in time for the Milan II release. What a great start - and what a great gift for the Atari Community. And what a great confirmation that KCS II Omega is still for sale from Emile Tobenfield, its developer.

yep, and most of it is at Apple. Really, failing to declare the $90M
jet in the profit report...

the only thing "dead" here is YOU, TiFKAS. From the neck up.

$69 for TR III on the Mac - when one can buy it for the PC for $29.99
- is also considered extreme. So is charging an extra $200 for an iBook
with a paint job....

>
> It's good to know that Jeff Minter aka Yak is at it again..He has a

TiFKAS is obviously still upset that the great YAK humiliated him
personally and publically by rightly pointing out that he was a "wanker,
a tosspot and a turd".

YAK was even mentioned in a major story on Atari's masterminds in
WIRED a few years ago, thereby making him more famous than TiFKAS will
ever be. Jealous, huh?

Don't worry, TiFKAS, when WIRED does a story on Lying Internet Kooks
Who Can't Spell Who Pretend To Be Apple Power Reps, you'll be the first
on the list :)

BZZT! WRONG! BOTH have been updated on a regular basis, with news and
specs on the Milan II added just last year. A year off, aren't you
TiFKAS?

The only thing "suspicious" is TiFKAS' claims that he's an "Apple
Power Rep", when his obvious lack of spelling and computer knowledge
makes him an obvious candidate for "Internet KOOK of the Month"....

Apple sold $90 million in their ARM holdings to pay for it. So the
issue is moot.

> the only thing "dead" here is YOU, TiFKAS. From the neck up.

I did not know that..

>
> Is this superior to SCSI? Is it superior to a parallel connection with a
> printer?

USB is superior because of flexibility. 127 USB devices can be hooked
up via USB Hubs..SCSI is old and can have only 7 SCSI devices hooked up
at the same time. Look at the latest ClubMac catalog and count all the
available USB and SCSI products..

> Finally, why has Sinclap totally abandoned all discussion toward midi?

It does Apple no credit that they have to BUY a good OS rather
than just develop it themselves. They're rather Microsoft in
this respect.

Although, at least they're doing with something that's defined
as an open standard. That's why you'll be able to run the same
tech on an Atari Falcon if you really wanted to.

Less hardware support, less software support, doesn't have
enough games coming out for it this year.

[deletia]

CivCTP was running on Macs via Linux before it had been
ported to MacOS.

Sierra Online, who helped support the Apple gaming community since
the days of the Apple II and the first few struggling years of the Mac.
Does the names Ken and Roberta Williams ring a bell?

To put it more bluntly, Sierra Online, the company that pulled the
plug on the development of Half-Life and Pharoah for the Mac, because of
low sales.

Anyone who's supposed to be an "Apple Power Rep" who don't know who
Sierra Online are is obviously faking it....

(insert picture of TiFKAS picking up piles of bloody Chiclets off the
floor - HIS. Virtually, of course :))

>
> > BTW, you left the "i" out of "Bullshit"...

there's a difference in prices in the Staes, too, TiFKAS. Has nothing
to do with "taxes"

MacAddict also has issues with overcharging $200 for an iBook with a
paint job....

> > TiFKAS is obviously still upset that the great YAK humiliated him

>
> You have not seen the ATI ones on the G4's...Your asertion is crap!

let's see:

TiFKAS can't spell "assertion".

A few posts ago, TiFKAS HIMSELF called ATI cards "crap", until he was
informed that that was what was in the iMacs and G4s. TiFKAS did an
about-face and now thinks they're the biggest thing since powdered toast.
Just like the about-face he did when he called Steve Jobs an "arrogant
bonehead" who would "destroy Apple if he came back", yet the minute
Steve was made iCEO, TiFKAS was immediately applying his tongue to
Steve's boots. :)

And if ATI cards are the bee's knees, TiFKAS, then why are many Mac
gamers ripping out the ATI cards and replacing them with better ones
like Voodoo 3s?

Since you are so obsessed with "crap", TiFKAS - why don't you do the
world a favour and flush your head? :)

First, Doom(has been a $9.99 title for ever) and many other titles have
staying power due to low price and are cheap when one is buying a
system..Called milking for all its worth. VGS is no different.

So it is off the hook when promoting a failed console.. Even an idiot
knew that the Jag would flop and put Atari in the drain..

> .Weeks later...sinclap's redemption came when Atari
> > dropped out of the video game market and disapeared...Does not Yak feel

Sounds like you have it all nailed down..Must be the cartoon watching
with such language such as this..

> > > BTW, words that TiFKAS Mispelled in this post:
> > >

> system..Called milking for all its worth. VGS is no different.

sure it is! DOOM was (and still is) a successful product, made
millions of dollars, and has sold thousands of PCs to people who have
wanted to play this game. Whereas VGS died a dog's death software-wise,
and has sold a grand total of ZERO iMacs (because, let's face it, if you
want to play Playstation games, what do you want to buy, a overpriced
underpowered iMac that starts at a grand AND a program that only plays a
percentage of the games, or a REAL Playstation that is 100% compatible
with all games and costs around $100).

BTW, that's the PC version of DOOM going for $9.99. Mac version goes
for around $24.99 in these parts....

You lost big time on this TiFKAS. Time to admit you are wrong. And
with the Playstation 2 now out in Japan (sold 1,000,000 units in two
hours in Japan), VGS is now yesterday's news.....

> ton of bricks...and you know this...

again, since you're so dense, here's the figures again.

It's obvious that you're willfully ignoring the evidence....

Yet another person who has let Apple's irresponsible hype influence
subjective observations. The G4 is not even close to 850 MHz Athlon
performance in general, although in certain specific conditions it may
be faster, just like in certain specific conditions a 450 MHz PIII may
be much faster than a 450 MHz G4.

Following is a list of benchmarks comparing the G4 to PCs that I am aware of. If anybody has any to add to the list, I would be very interested. Some have provided some individual RC5/SETI scores, but I have been unable to find a URL that lists a group of such scores by processor and processor speed (although I haven't looked very hard). Maybe some Mac advocate can find such URL(s) for me, since my understanding is that the G4 does very well on those applications.

ROTFLMAO!

Really, TiFKAS, you are SUCH a loser! Not only do you not know BEANS
about the video market, or MIDI, you also now show extremely vast
ignorance about the history of Apple gaming!

I'd suggest getting ahold of the book HACKERS, which goes through the
entire early history of the computer gaming market - and you'll ALSO see
that Sierra Online was a MAJOR pusher of the Apple as a games
platform....
>
> > To put it more bluntly, Sierra Online, the company that pulled the

not a janitor, TiFKAS. Sales. And doing well.

with logic like that, you'll be the janitor in no time - at Intel.

Ah, still relying on the Daily Tubby for your info on Canada, TiFKAS?

The National Post is an even BIGGER joke - according to a recent
Angus Reid poll, only one in ten Canadians trust the info placed in that
rag - it seems "Tubby" Black's temper tantrums about not being made an
English Lord, despite the fact that it's AGAINST CANADIAN LAW for him to
be allowed to do so, is backfiring on him, as well as his ill-fated
putting his foot in his mouth about Augusto Pinochet having a "Bum rap"
on human rights. The paper is losing money hand-over-fist.

enjoying a nice revival - seems there's been another announcement of
another Falcon game - on CD-ROM!- yesterday. Three new games, a new
office suite, two new Atari mags announced in the last two weeks.

Jaguar - five new games in three weeks. Another nice revival.

they don't have to sue, becuase they already know the truth, that the
850 mHZ Athlon absolutely crushes the G4. As well as the 900 MHz model,
and the 1.0 gig model. Looks like Apple is being left in the dust....

So? The web is supposed to be based on open standards. Plus,
many people still just don't have the bandwidth to deal with
most of the extra fluff that wouldn't make the web an open
standard.

Plus, Opera runs so much faster than NS or IE once you do
crank up the speed of the network it isn't even funny...

even funnier, since when has Adobe EVER PRODUCED MIDI software?
They're known for DTP and graphics software products, NOT MIDI. And no
shop here in Toronto or anywhere I've been has carried an Adobe MIDI
product.

TiFKAS is obviously talking out another orifice when talking about
MIDI, or about anything for that matter. But then again, that's what we
can expect from a "poduct" expert.....

5088. MIDI-3 Announcement

Newsgroup: comp.sys.atari.advocacy
Date: 2000-03-06 00:00:00 UTC
From: mb@gem.win.co.nz
Message-ID: <dreibel-992CE1.10242706032000@bigmomma.idirect.com>
Source record: 1953

So, no new MIDI products for Atari, TiFKAS?

You may want to remove your foot from your mouth before you read this announcement....

ANNOUNCING THE RELEASE OF MIDI-3

MIDI-3 is a 3 MIDI output expander which attaches to the serial (modem) port of an Atari ST computer. When used in conjunction with MIDI sequencer
programs such as Notator and Cubase, MIDI-3 provides 3 extra independently
addressable MIDI outputs in addition to the Atari ST's standard MIDI output.

MIDI-3 is fully compatible with the original C-LAB EXPORT expander (no longer available), and works with any software that supports EXPORT.

SUMMARY OF FEATURES

* Provides 3 extra MIDI outputs on Atari ST or compable computers.
* Attaches to the serial (or modem) port.
* Fully compatible with EXPORT.
* "Plug and play" installation.
* No external power supplies or other connections are required.
* Available in cased (external) and uncased (internal) configurations.
* Very compact dimensions.

PRICING AND AVAILABILITY

MIDI-3 is available immediately in cased and uncased configurations. The cased configuration is suitable for external connection to a computer, while the uncased configuration would be useful for mounting inside a recased Atari ST.

Pricing for the MIDI-3 in New Zealand Dollars is as follows:

MIDI-3 cased: 110 NZD (40 GBP, 60 USD)
MIDI-3 uncased: 100 NZD (35 GBP, 50 USD)

Figures in Great Britan Pounds and United States Dollars are approximate and for reference only.

Quantity discounts are available in quantities starting at 5 units.

Latest Milan news, from the Magic Online web site:
Milan News! (March 4)
As earlier reported, the Milan II is scheduled to make it's first public appearance at the Silicium expo in France this weekend. Although not there yet, early details suggest that the Milan II will be there, but in modified form. The graphics card for example, is directly on the motherboard as opposed to PCI. This supports the theory that the main reason for the backed up release date was related to AGP support. The model to make an appearance will probably a 68060 @ a speedy 80mhz.

In other Milan news, the DDP translation team is helping translate the bundled Milan Software in preparation of the North American release. Expect to be able to pick up an American Milan II from your favorite computer shop near the beginning of summer.

Falcon030, 14mb ram, 540mb hd, 17" svga monitor, MagiC, Pagestream, NVDI, ExtedDos Pro, ICD HD utilities.

> with all games and costs around $100).

So what your saying is that the Millan II is a rip off? Because it
will be priced higher than an iMAC 350. The 350 mhz G3 processor is
considered low end of the PPC family compared to the 68060 processor
that should of been retired 5 years ago in computers...Only Atari!

The Playstation will be down to $50 when PII comes out. But it's nice
to play it on a PowerBook..Does Atari have notebooks?

> BTW, that's the PC version of DOOM going for $9.99. Mac version goes
> for around $24.99 in these parts....

Nope...here in the states down south, Doom and Doom II go for $9.99
each. Must be the high import taxes..

> You lost big time on this TiFKAS. Time to admit you are wrong. And
> with the Playstation 2 now out in Japan (sold 1,000,000 units in two
> hours in Japan), VGS is now yesterday's news.....

Why? PII will cost $370.00. I may even get one it comes to the
states. Sony will continue to support P1..

Chunk's has some explaining to do..He claimed that the Milan II would
be avilable in the states this month. Does the company know that Apple
may have moved onto other models this summer? Lets see, the iMac may
see several revisions just when the Milan sees the light of day on this
side of the Atalantic..

> side of the Atalantic..

how can "Chunks" make that claim, when it has been proven, over and
over, that your imaginary friend "Chunks" doesn't exist?

And since when did anyone claim that the Milan will be available in
NA this month? Again, TiFKAS twisting the truth.

Of course, using TIFKAS' own yardsticks, Steve "arrogant bonehead"
Jobs should have made sure the 500 MHz G4 towers were ready for shipping
before he opened his big yap about shipping them "in a few weeks" on
August 31st, 1999 - Feb 2000 is NOT "a few weeks".....

> of discontent..

hmm, TiFKAS can't even spell "peep"....

ah, but it was the San Jose Mercury who disclosed that Apple fudged
the report:

Geez, give someone an aircraft or two and they never let you live it
down. It's been a month and a half since Apple's Board of Directors
presented Steve with the gift that keeps on giving-- a Gulfstream V
jet-- and that teensy token of appreciation is still making headlines.
If they had just tossed the guy a wad of cash instead, no one would have
even blinked, but they asked themselves what they could get for the
Steve that has everything, came up with a prezzie that's both practical
and attractive, and suddenly the whole world's in a tizzy over Steve's
new jet. C'mon, folks, it's not like they gave him an island, or a small
country, or anything.

Apparently the latest controversy concerning the Jobs jet involves
Apple's classification of the $90 million it spent to buy the thing and
soften Steve'stax blow. Apple listed that sizeable chunk of change as a
"non-recurring expense." That sounds about right to us, unless the Board
plans to add to Steve's personal air force every time a Macworld Expo
rolls around; sure, that'd speed up Steve's plans for world domination,
but frankly, we just don't see the Board frittering away Apple's cash on
regular jet bonuses for the iCEO. The thing is, though, from an
accounting standpoint, employee bonuses are typically classified as
compensation-- a "recurring" event. So according to the San Jose
Mercury News, the question on the lips of analysts everywhere is this:
did Apple misclassify the jet in a deliberate attempt to beat the Street
when the quarterly results were announced? If the jet had been listed as
a recurring expense, Apple would have reported only an $88 million
profit last quarter-- well below the analyst consensus. It's even

possible that the Board allocated $90 million as a bonus for Steve and
then went shopping for something to spend it on, with the express goal
of being able to list that money as a non-recurring event.

again, dodging the question.

If MacAddict rated TiFKAS for his advocacy, he'd get their
highly-covetted BLECH! rating....

>
> > who also aren't pleased about the discovery that iBooks have
> > self-destructing hard drive partitions.....
>
> In a few..Thats fixed in the new ones..

now that is a lie and a half, TiFKAS. According to both Macintouch
and Low End Mac, the defective iBooks are an epidemic, and Apple
admitted that themselves - and as of yet, they have no solutions to the
problems, even after several months. Macintouch is also now reporting
that there are problems with the iBook cases cracking - even in the new
iBook SEs.

Did the makers of the Milan fix
> the high defective rate of that box or are they different?

making a mountain out of a molehill, TiFKAS? Where is your evidence
that there was a "highly defective rate" of faulty Milans? Even Matthias
Jaap, the fellow whose article you took out if context, came out here
and said you were giving out a load of horse hockey....

I agree. I use MIDI every day..it's my job. Don't f**king insult my intelligence, TiFKAS; what on earth do you KNOW about MIDI? More to the point, how many
musicians do you know who have sought out a Mac Plus for sequencing. Oh, and do you like Cubase VST for the Mac? There would be NO VST without the R&D steinberg did in releasing Cubase Audio Falcon (incidentally the first version of Cubase Audio). The only really essential, irreplaceable music platform on the mac
is Pro Tools....and even that is going over to the PC.

Lata!

Compared to what? Raw performance is equivalent or better
than anything else barring something small and single user
like Be. Even that is a skewed comparison (as would be a
comparison between Mach+DSD and Be).

Be has the advantage of being tailored to the task.

Linux or FreeBSD can be similarly tailored. Plus, the end
result won't be restricted to those systems that Gasse
thinks are easy to support. That aspect of Be rather annoys
me. An org is more willing and successful when it comes to
supporting G4's than a corp is.

>
>You can get Linux for virtually any platform though, including Mac.

Yup, and it's media device support is better perversely
enough. Linux lags in codecs in general and especially
the highly proprietary ones. This is one area where Be
could really stomp all over the freenixes if Be really
had their act together (but they don't).

5111. The reality of it

Newsgroup: comp.sys.atari.advocacy
Date: 2000-03-08 00:00:00 UTC
From: Lonny Pursell <root@bright.net>
Message-ID: <Pine.MNT.4.10.10003081652170.106-100000@TT030>
Source record: 1976

Did some surfing on the apple site, and I must say it had me
rolling on the floor laughing. The mac will finally get
premptive multitasking. Ooohhh. Aahhhhh. Wow that was done
years ago on so called inferior machines in the mid 80's.
And on top of that the apple site reads like a text book for
pre-schoolers so that mac users can sort out what it all means.
Don't get me wrong, I think the PPC chip is an ok chip but
come on now, apple and others just take ideas and stuff that
was pioneered years ago, and introduces them, or re-introduces
them as some new cool feature. When it reality it really the
same old crap, but with a new bigger price tag.
Basically all they do is run faster, and nothing more.

I do give credit to apple for having the balls to make radical
changes to their OS, however it's nothing I havn't seen or
used before for years.

The thing that sets sinflap apart from the rest of us here is
his/her not knowing which platform he really has or likes.
As much time as is spent here, one has to wonder.
I don't surf the mac usenet sites posting negative msg's daily.
Starting to think perhaps him/her had a spose leave cause of
some fiasco with an atari? Got caught with the joystick in the
wrong place? There has to be some explaination for such hatred.

Holy cow ... sounds like night of the living dead !!!

You see these poor Amiga diehards bumping around on the web, sermonizing
about how the Amiga will inherit the earth. I though Atari owners had
more self respect and smarts to get bogged down in that dream.

I've been using Pagestream (Mac) for seems like around 4 or 5 years now
(was in beta for a while).

Personally I found 3.3r7 to be the most stable version. I haven't tried
Pagestream 4.

Compared to Pagestream (Atari) the files and postscript are huge. And
I'd grow wiskers trying to run it on a well-spec'ed Quadra 950 or
8100/80. It goes ok on my 8600/200, but sadly I've been forced to start
migrating design setups to other applications due to the problems with
accessing advanced print features on higher-end digital/laser printers.

Atari and Amiga files can be opened in the Mac version but some bits
don't come across properly. However it does ok for some layouts.

5118. TAF Meeting March 15th - Emulating ST on Macintosh

Newsgroup: comp.sys.atari.advocacy
Date: 2000-03-09 00:00:00 UTC
From: "Daniel L. Dreibelbis" <dreibel@idirect.com>
Message-ID: <dreibel-A55C84.08184809032000@bigmomma.idirect.com>
Source record: 1983
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy,comp.sys.mac.advocacy

Itinerary for the March 15th. 2000 meeting of the Toronto Atari Federation....

Are you the proud owner of an Apple iMac, PowerBook, iBook, G3/G4 Tower or older PowerPC computer? Do you miss playing your old Atari ST games, or is there an application out there from your ST days that you just can't find a replacement for? Want to amaze your other Mac buddies? Have you wondered about what all this fuss is about emulating older platforms on newer machines?

Well, tonight's meeting may have the answers to these and other questions you may have - for we'll be demonstrating the Atari ST emulator NoSTalgia. An amazing feat of programming, NoSTalgia allows you to run a wide variety of Atari software - including MIDI software - on your Macintosh. We'll also be touching on other Mac emulators, including MagiCMac.

Yes, tonight will be an informative and fun night of demonstrations not only for Atari users, but for Mac users as well. Be sure to make time for this interesting seminar!

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Those coming by public transport can take the TTC Yonge Line north to North York Centre Station. $2 for non-members. Dues are $25 per year, and includes a subscription to the newsletter PHOENIX. Membership in TAF IS Atari support!

Ken MacDonald, president: anarkist@idirect.com, 416-533-0504
Dan Dreibelbis, Vice-President: dreibel@idirect.com 416-766-4743

No, they're both marginal.

One's a just a little more so.

As far as Amigas go: there's one company porting new apps to the
PPC version of AmigaOS right along side MacOS and Linux versions...

Apple doesn't really need any help doing that... killing the
mac that is. They already price their more serious desktop
PC's at about the same price as twice faster clocked brand name
PC systems (GW2K, Compaq).

Twice the cost leaves a lot of room for TCO finaegle
even in the worst case. This assertion doesn't even
address the less problematic installation.

>

This is likely a Win9x oriented anecdote. Other x86 OSes aren't
nearly as problematic. Even Win 3.1 is less failure prone in
this particular aspect.

If you wish to merely throw money at the issue, you can just
pay a little more for NT.

>stories about them out here in our neck of the woods.

When the Open spec PPC boards finally hit the street, I'm there.
However, Steve's PPCs just don't quite do it for me. If I'm going
to blow that kind of money on a system, I'd much rather get an
Alpha or mebbe even a Sparc.

> PC's at about the same price as twice faster clocked brand name
> PC systems (GW2K, Compaq).

A decent Mac system does cost a bit more up front, but saves a bundle in time and / or support charges later on.

I split my time between two businesses - one providing PC support and one digital print & copy services. In the shop whereever possible I run Mac (with pleasure), Atari (with pleasure) and Windows (where unavoidable). The Atari never needs anything - just goes. The Macs mainly just keep on going. PC's - every so often something screws up the registry and the most efficient cure seems to be "Format c:" and re-install. If I had as much trouble as some client sites with PC's, I'd be out of the print business. As for Compaq, I could tell a few stories about them out here in our neck of the woods.

But hey, I hear where you guys are coming from. I think these Mac guys are just over here yanking your chain to get a reaction.

No new software for the Atari, TiFKAS? EAT THIS!

Hi there, the new Enemywar II for the Ataris shown above is now released and
availabe on CD-ROM for 69 DM + packaging. Please contact me at
markus.binder@t-online.de The game itself is about 8,5 megabyte big and
ueses the 16 bit true color mode. It's a strategical game for 2 players with
very good graphics and nice sound effects! :-)

<Omikronman>

> out of the woods.

already has, m'boy - new Calamus announced for the Milan, a new
Papyrus Office Suite, three new games, GFA Basic 3.6 has been
re-released in Germany.

Small, but building.
>
> Love your Atari for what it was and is - and a Mac-killer it ain't!!!

I use both at home - Mac for most of my day to day things, Falcon for
MIDI and as a backup system when the Mac goes down (makes a great
Internet system).

Besides, my function here is to cancel out TiFKAS' signal-to-noise
ratio - it's rather a fun activity, poking trolls with sticks until they
squeak :)

Which is still crap. I could also tell a lot of horror stories
on work wasted because NT is not quite 95-compatible and a lot
of applications that advertise themselves as "95/98/NT" really
are a crap on NT.

> Steve's PPCs just don't quite do it for me. If I'm going to

iMacs _are_ really cute user appliances. Nothing really feels
like you are using a computer anymore. The size and combination
of features is right too. What I really don't get is why they
think they can get away with charging twice the price of an
equivalently-equipped PC. Heck, even an Alpha-based machine can
be built for about the same price as a meatball PC, nowadays.

So TiFKAS, clutching at straws, goes and mindlessly posts an Apple web site. In Canadian dollars, I am right. And PC prices are much much less than the inflated Apple pricing

BTW, TiFKAS, while you're on the Apple web site, check out the Tech section - they finally admitted, after months of customer complaints, that iBook hard drives self-destruct. And that a solution to the problem is "pending" - it has NOT been "solved".

So much for TiFKAS' credibility as an "Apple Power Rep". Which is not and never was.....

While I will certainly agree that when comparing against
VMS or Unix that NT is crap. However, compared to MacOS,
it just isn't so.

The existence of crap for a particular platform is hardly
a compelling argument. The state of software engineering
is non-existent in general. That's what REAL OSes are for,
to deal with the common crud without any major inconvenience.

Here in the states, the iMac's are priced to go...The market has determined the price and that is reflected in Apple's price share...which sinclap is still kicking himself for cashing most out at $55 to pay the rent...

Oh well..

Actually, mach is somewhat crufty and inefficient when compared
to BeOS. This can also be labeled 'mature'. It can also be
labeled as 'buying 10 year old tech' and recycling it.

While that might fly for free software, or even Microsoft,
Apple should be better than that. Otherwise, they have no
real point existing at all.

>bubble here...When Apple bought Next, they brought everyone else on
>board from the company, like... SJobs, Avie, and Mitch Mandich. if

They would have had something resembling a modern OS 2 years
earlier. That much is certain.

Sorry, but we're not impressed by Redmondian marketing rhertoric
here. If you can't articulate just what utility has been added
then you clearly have no clue. 'remaining competitive' is just
bad rhetoric for indulging in creeping featuritis for the sake
of marketing.

This is great, but it will take alot for me to switch from my Hades060.
The 80mhz speed is nice (compared to 60mhz on my Hades), but the more
important thing is software/hardware support. If things come out for
the Milan than isn't available for the hades, then I may switch.
Hardware support is a big thing with me (sound boards etc). I will just
watch and see what happens. In any case, I wish the Milan all the best
and hope it makes a killing....

Well...the Amiga platform is more healthier than the ST one...Just as
Newtek...

sinclap!

Hi People,

Good there are still some real atari fans, but I don't understand the fuzz about the Milan. Why the hell buy a 68040/60 machine nowadays? (Okay has some sentimental value) But for the ordinary user ???
Oh it got USB wow , my 3 years old pentium 200 mmx has it too . The rest of the hardware I can plug in my PC with ease. I bet it won't cost me more money.
The reason I bought a Atari ST in 1990 was its price/power perfomance (It was half the price of the cheapest Mac or PC!) And I think it was a very good buy , and I've been using a upgraded version of it till last summer. But then I bought a 486 for about $75. With a little upgrading and an other motherboard from sister I now have a computer which I can get new released software for.
This a luxury I've not had for more than 5 years. OK the PC isn't perfect , but is a releave not having to spend hours in setting up your internet account and being able the buy games far better than ever produced for the Atari in the store next door.
The only thing why I kept my Atari for that a long time was I that I lot of knowledge about the thing and thus I liked programming on it and the challenge getting something reasonable out of it. But rationally they lost battle with the Falcon. This was (ok some features were unique but not necessary) the first computer from Atari which hadn't a better price/perfomance ratio than the PC. (Except for some musicians , because of the robustness and the standard MIDI ports)
I know a probably I get a reaction like this Atari computer has this feature or another has this feature. But the overall score is that an not already Atari user would be crazy to buy something like a Milan. And everybody knows there are not a lot Atari users anymore.

Greetings
Erik Karsies

Still owner, but not user of an Atari 800 XL, VC2600 and 1040STfm

And owner and user of a pentium 200mmx ;)

Go to www.cnet.com and do a search under games and then sort by price.The first thing that you will notice is that PC games outnumber Mac games by at least a factor of 5 to 1. It might be as high as 10:1 in favor of the PC. Secondly, with a few exceptions, the price of the same Mac game compared to its PC counterpart is anywhere from 25% to 100% higher. Quoting prices for old games being sold as close outs makes one wonder about the soundness of the old "wetware".

As for "soon to be somewere in CA" - I don't think so. We have already got your photo on every milk carton in the state :)

no, dodging the question. If the MacAddict readers don't like what
they see, it means that Apple has failed....
>
> >
> > If MacAddict rated TiFKAS for his advocacy, he'd get their
> > highly-covetted BLECH! rating....

> ROFLMAO! So you read Mac Addict...why?

1) because I own a Mac.

2) because they give highly accurate, fun-to-read reviews.

3) because I know I can trust them for no-BS views of Apple without
having any of them lick Apple's boots, unlike a certain troll with no
life who claims to be an "Apple Power Rep".

What ever happened to web
> sites like Ataricentral, atarinn and etc...that are updated daily. You
> will need them if the Milan will ever be viable..

still read them, TiFKAS. Milan is still viable....
>

> The solution to the problem has been announced..You know were to go..

there still is no solution, TiFKAS - they have an idea of what the
problem is, but the software to fix it isn't out yet. Besides, I
wouldn't be crowing too much about this, Apple sat with their thumb in
their ass for months before consumer pressure finally forced them to
admit there was a problem, and you denied there was a problem.

Ohm, yeah, and how have they solved the cracking iBook SE problem,
which is proving to be a similar fiasco. Maybe they should rename it
iEdsel....

BTW, it's spelled "where".....

Again, TiFKAS dodges the issue. The Pippin was a major embarassing
flop for Apple, to the point that they never released it here in NA. And
an even bigger flop than the Jaguar....

>
> Dodging it ..

nope, TiFKAS is the one "dodging it" Unfortunately, it keeps tracking
him and beaning him, breaking his brain.

Products can be delayed for very good reasons, and one reason for the
Milan delay may well be some improvements they may make to it.

Jobs was irresponsible for making promises on delivery that he
couldn't keep, and now he's reaping all sorts of criticism for it. And
in the meantime, thanks to lost opportunity, the AMD juggernaut is now
making people who were thinking about going to the already-old G4
architecture to "think different".....

if TiFKAS shows up, we'll set up a concession stand where TAF members
and guests can purchase rotten tomatoes to throw at him, so we can see
if he's as good at dodging produce as he is at avoiding answering tough
questions in advocacy. All proceeds will go to charity, of course....

Also of course, TiFKAS will have to be able to get over the border to
attend, which we doubt he'll be able too, Ontario's anti-rabies patrol
are pretty strict....

>
> Video tape it and put on TAFT web site for later viewing..

not a bad idea, TiFKAS. We'll have to ask the maintainer of the web
site to see if he has the room....

HMMM, TiFKAS can't even spell acronyms right....

Sorry ??? Pagestream and Calamus SL run rings around what ?

Pagestream 2.2b (Atari) is a great little piece of software, but a Mac
applications killer it ain't. I seem to recall in a discussion thread
one time Deron saying something about "He couldn't believe he produced
software like that" in a negative vein. I thought that was a bit harsh
if that's what he meant, but Pagestream (Mac) is a huge advance over
Pagestream 2.2.

Subject: An User Formerly known as Atari-junk

>Hi People, Good there are still some real atari fans, but I don't
>understand the fuzz about the Milan. Why the hell buy a 68040/60
>machine nowadays?

Because it is a viable upgrade for those who still want to use the Atari TOS platform. Similar to those using Hades/Medusa CLab Falcons and Mac or PC emulators in order to get faster Ataris.

>(Okay has some sentimental value) But for the ordinary user ??? Oh it
>got USB wow , my 3 years old pentium 200 mmx has it too .

And you 3 year old Pentium is probably due to be tossed soon. As I have started to see my many games requiring more than 200mhz regardless of the 3d board. So like a 1040ST user you will probably upgrade to a higher spec PC in the next year or two.

>The rest of the hardware I can plug in my PC with ease. I bet it won't
>cost me more money.

Really??? Regardless, USB opens up opportunities for low cost peripherals for Atari computers. I am not a fan of USB. It is slower and inferior. But it is cheaper to produce devices for. Not necessarily better, but more mainstream toward the ordinary user.

>The reason I bought a Atari ST in 1990 was its price/power perfomance
>(It was half the price of the cheapest Mac or PC!) And I think it was a
>very good buy , and I've been using a upgraded version of it till last
>summer.

Fact is in 1990 the ST was already 5 years old, and in many respects obsolete compared to all other platforms with regard to speed and graphics. That doesn't detract from the power of the Atari, just an observation. Thus you buying a 5 year old computer that is long of tooth then and getting another 8 years from it is more proof in its performance than a spec sheet.

Therefore, even though one could argue that in 1990 the Atari ST clearly wasn't a good buy, the fact that you used one for so long proves that it was a good buy. I use my 520ST to this day.

>But then I bought a 486 for about $75. With a little upgrading and an
>other motherboard from sister I now have a computer which I can get new
>released software for.

Well, you can get new released software for the Atari today. Their isn't as much as is available for the PC and there never, ever, has been. There wasn't in 1990, 1985 or 2000, but that didn't stop the Obsolete low cost, limited software ST from being a good purchase in 1990 for you then.

I don't know what new software is available for the 486. Windows 2000? Certainly their is older software, or you can join the Linux ranks.
I don't know of any new commercial games out for the 486.

But generally, no, a 486 doesn't run new software and a P200 is running out of steam because of the bloatware.

However, a computer value is based on what you the user gets out of the computer. Therefore it is not necessarily based on new devices, software or games if you are able to use the older software to its maximum potential.

Problem is much PC software isn't optimised, unlike software that is developed for the Atari (including the Milan).

> This a luxury I've not had for more than 5 years. OK the PC isn't
>perfect , but is a releave not having to spend hours in setting up your
>internet account

IConnect takes about as much time as typing in your name and password and Email address and pop server.

Setting up STing requires you to set up the .cpx files in the cpx folder and editing a .inf file stating where the STING STX files are located such as

D:\INTERNET\STING\

PAP/PPP is as simple as typing in name and password.

Those using older PCs and earlier versions of IE and Netscape are no longer being supported by Large IP providers anylonger. Therefore you will have to know as much about setting up the earlier versions of IE or Net as you do STING and ICONNECT or MINTNET as the CDs and tech support will no longer be useful to users with slower computers and low ram. Some IP providers only provide support for one or the other.

>and being able the buy games far better than ever produced for the Atari
in the store next door.

Always debateable. Considering that the craze in late 80s and 90s was TETRIS, hardly demanding, games are not driven by 3D accerators alone. As their are thousands of ST games I have never played, I figure the same would be true of PC games only 100s of thousands. A good game is a good game. I have my favourites on the Atari and clearly someone like them enough to want ot run them on emulators. Can't be that bad.
Atari stores where never prominant compared to PC stores. By 1990 here in Canada virtually 80% of Atari Stores where long gone, and there weren't many to begin with. So comparing the # of stores and games has been the same as always regardless of whether it be an ST/Falcon or Milan.

Games are very hardware demanding, thus games are what are obsoleting your PC. And new games don't work on your 486.

A good game on a 486 and ST is D-Day made in 1992. Not much difference between the games other than the PC works in a higher res, but the RGB on the ST produces sharper colour. (THink of BattleCHess on Amiga/ST vs PC).

Game requirements.

Atari ST 1Meg of Ram

Amiga 1 Meg of Ram

Starting the Game: insert disk and switch on computer.

DONE

Now for the PC.
---

1) Start PC using DOS (Most PC runs Windows)

Note: if the message "not enough memory" is displayed on the screen after

starting DDAY it is due to a shortage of memory.

To know how much memory you have typ MEM CHKDSK then Enter

A) You can free up some memory by modifying the AUTO EXEC.BAT and CONFIG.SYS files. Read your DOS DOCUMENTATION .

B) Reduce the # of FILES and BUFFERS in the CONFIG.SYS file

-Put in text string the resident programs that use memory such as: DOSKEY, SMARTDRIVE, SHARE, SETVER....etc.... (etc... is straight from the

manual)

-if you have DOS 5.0 or later , check that resident programs are loaded into high memory LH and DH.

2) Create a boot disk: Insert blank disk in drive A. Format the disk by typing format A/S then ENTER.

Simply switch on the computer again with this disk in drive A and wait for the machine to boot. You should have enough memory.

INSERT the DDAY DISK 1 in Drive A

Type DDAY

(We strongly advise you to install DDAY on your HD.)

Type INSTALL C:

The computer will make a directory called DDAY

To start the game from Hard Disk, just go in the DDAY file by typing CD DDAY then type DDAY

or

TWO Options for loading on your PC

DDAY J Cancel the reading of the joystick: on some PCs without JoyStick the space and memory is used for other purpose. THe program looses a lot of time reading wrong data, whcih results in slowing down the game and provoking in opportune "clicks"

DDAY L If the game is to slow on your PC.

You can combine these two options by typing DDAY JL

Other problems on PC.

The rapidity of the mouse can be adjusted with DOS. If you have changed the standard parameter for drawing software for example, don't forget that some problems may occur (SUCH AS EXCESSIVE SLOWNESS), go back to regular parameters.

Prepare a blank disk to save the current game

We prefer to save data on disk rather than on the HARD DISK to reduce the

number of accessess to your PC.

Just after you have started the game, the program asks you what type of graphics card you use. If your VGA screen displays 16 colours or if your machine is too slow, you should choose VGA by pressing the F3 key. (For EGA type screens select EGA). To know what type of video card your PC has, read the video card manual, and if worse comes to worst, try all the

different options starting from EGA!

Then indicate the sound card by pressing corresponding key.

We advise you to use the mouse on the PC (compulsory on ST and AMIGA), but it is possible to play using the keyboard. The curser is controlled by arrow keys, the left button SPACEBAR andthe Right Button RETURN.

(THeres more but I am done typing)

In a nutshell, ST users are running a game on the ST by putting a disk in the computer. Load and go. No trouble with graphics or speed. Same for Amiga Users.

If a PC user can Play this game on their 486, then the same PC former ST user should have NO TROUBLE installing internet software on an ST.

Follow the instructions and you will arrive at your destination.

> The only thing why I kept my Atari for that a long time was I that I lot of knowledge about the thing and thus I liked programming on it and the challenge getting something reasonable out of it.

I think that is true for many ST users.

>But rationally they lost battle with the Falcon. This was (ok some features were unique but not necessary) the first computer from Atari which hadn't a better price/perfomance ratio than the PC.

This too could be argued. Fact is you have stated essentially that an ST is a better purchase than a 386 PC with SVGA and HD and CD, as you purchased an ST in 1990. ST of similar stature would exceed in terms of cost the PC described. And the ST would not receive a similar graphic potential of a PC.

Don't get me wrong, I know ST graphic capabilities and limitations. Same for PCs of this era.

As I have picked up a second hand Falcon after the fact, I can quite easily tell you that the price and performance of the Falcon would not have been the major Obstacle. It is a computer that was clearly ahead of its time, and a PC of that era cannot match it in terms of performance.

I believe you make this statement not based on using a Falcon. But based on Ataris abandonment of the Bird in order to promote four legged land based machines.

What I am saying here, is that you are wrong to assume that the power to price comparision is any different to the ST power to price comparision VS a current PC of the Era. The Falcon is a great machine. If one has owned an Falcon from new and now purchases hardware upgrades, they come in a league that a 486 could never ever attain. There are too many limitations in the Hardware and the OS that cripple a perfectly good and powerful chip.

As you have programmed and ST, you must know the problems encountered when programming on PCs of this era.

Now find a used Falcon for $75. Pretty much impossible. However, I can find used P75s and 150s for free here. All this tells me is that my old crappy Ataris have more value upon resale in a marginal market. But my more current/powerful/ yet more obsolete PC has no value. And a 486 would be far below these specs of the P75 and P150.

>(Except for some musicians , because of the robustness and the standard
> MIDI ports)
> I know a probably I get a reaction like this Atari computer has this
>feature or another has this feature. But the overall score is that an
>not already Atari user would be crazy to buy something like a Milan. And
>everybody knows there are not a lot Atari users anymore.

Yes, Erik, I would have to agree with you about both of these statements.

But the Milan provides a Stepping stone and path of development and growth for the ST/TOS line. There is no reason to believe that the Development will not continue. Now as a 1040ST is no longer the power users machine, a Milan is a viable upgrade. As is a Falcon Or TT. However the Milan does allow for access to USB.

However, none of this takes away from the fact that you can use your ST to this day and use the new software that is being developed. I really don't believe that this is the case for a 386 of that era nor a 486.

Of course in the public domain all formats and all computers make model year are supported, as each platform has their enthusiasts.

Regardless, you are correct. A PC/MAC or former Amiga user would not consider an Atari Clone as an Alternative. However this was the case when the Atari was a State of the Art machine with High Quality software. Nothing has changed with regard to purchasing an Atari.

A Calamus Users, will definitely benefit from the Milan. I think it is a better alternative than running MAGIC PC and Calamus. A PC version of Calamus will never arrive now, as the project was shelved, and I must figure it became a total failure, in attempting to do the port.

I myself am an Atari User, and I am looking forward to the Milan, as well as each new software release for my ST in the year 2000.

But simply because I find a PC boring. Not incapable, which is how I perceived a PC in 1985, when I purchased my ST.

>
>Still owner, but not user of an Atari 800 XL, VC2600 and 1040STfm And owner and user of a pentium 200mmx ;)

As long as you want to keep up with computing, your 200mmx will be sitting with the 1040STfm and a 850MHZ or more will be what you are using. Technology waits for no one.

Later Brian.

> Milan delay may well be some improvements they may make to it.

After your hissy piss and jumping up and down...you asserted that the
Milan would be available..

Plus the product life cycle has run out....Other firms have moved on to
the next new series..

> Jobs was irresponsible for making promises on delivery that he

The fact still remains that you can't articulate just what it is
that the MIDI running ST or Falcon users are missing out on. Thus
they are perfectly justified in presuming that they are not infact
missing out on anything except perhaps some added cost.

>
>Either you get with the program....or get out of the way...

Not really. It's just that most ST's out there are privately
used for music or DTP only, because it was sold that way, so
Atari users are less noisy. When I was working in a computer
store in the late 80's, we sold an equal amount of both but
people bying an ST specifically did so for music or DTP. Amiga
was a more generic "wonder box" that computer freaks bought.

Because MiNT and NAES blows Windoezs off the hard disk.
What do you do while you wait for your PC to boot up?
What do you do while you wait for your PC to boot up after a crash?
What do you do while you wait for 10mb applications to download?
What do you do when you find out your 200 mmx is slower than a Milan
060?
You buy an Atari Clone.

Mikey

>
> Americans sail through with ease with badly needed U.S. dollars to
> suppor the economy..

except for the ones like TiFKAS, for whom they are ready with the
rubber gloves and the tranquilizer darts....

more likely the Americans are coming to buy inexpensive products of
equal value to badly overpriced goods in the American stores. We value
American tourists, it's one reason why our economy here has been booming
as of late

BTW, why trust TiFKAS, a child who can't even spell "support", to
comment accurately on the current strong Canadian economy? And who

admittedly uses as his basis for his "info" the National Pest, a source which a recent poll here has shown that less than 9% of Canadians trust for accurate reporting, thanks in part to the crybabying of his personal hero Conrad "Tubby" Black, who's upset that the government won't let him become an English Lord? TiFKAS should be more concerned that the Daily Tubby is currently drowning in red ink....

It's always hilarious to see TiFKAS, when losing an argument, to go as far to attack an entire country. Could it be because the guys most successful at kicking his butt come from Canada?

> >
> > HMMM, TiFKAS can't even spell acronyms right....

Ed McMahon, Paul Schaffer and Andy Richter have made a comfortable career of being second banana to the big Kahuna.

and look who's talking about having "no ambition" the same loser who can't bring himself to post to Mac areas like mac.advocacy, probably because he'd be burnt beyond recognition in seconds. But then again, from what I've noticed in human behaviour, the biggest bullies are also the biggest cowards...

> sinclap!
>

400Mhz Celerons can be had for about $330, so that's not
really a useful comparison...

Well it is if replying to this post. It is what the guy uses. Most
"kids" don't have $330.00 to throw around. Besides, who would be dumb
enough to purchase a Celeron? A waste of money as far as I am concerned.
Get a Mac if you want speed and relaibility. Get a PC if you like self
torture.

PC stuff is dirt-cheap or free because it is obsolete even before
it hits the market. Second-hand Atari hardware still sells for a
good price because it is still as up-to-date as it gets.

Whether or not it's obsolete has little bearing on whether
or not it will successfully manage your computing tasks.
This is the same principle that allows an 060 machine to
be even remotely useful.

[deletia]

As far as the Milans being 'as up-to-date as it gets', don't
kid yourself. They're not that by a long shot. They shouldn't
be presented as such. Doing so will only make you look foolish
and undermine what appeal a Milan might have.

Hello,
Just received this message :

Combined Atari & Amiga Expo May 20 and 21 in Neuss (near Hannover,
Germany). Organised by the Falke Verlag, publisher of (both !) the Atari
magazine "STC" and the Amiga magazine "Amiga-Future.
Always a great event and this year even better, together with the Amiga clan
!
cheers
Dan

This is not entirely true. The issue common to all minority
platforms is lack of "software/hardware support" not lack of
performance. Be, Linux, FreeBSD & OS/2 all run circles
around the WinDOSes.

Infact, the resident Atari holdouts would be well advised to
see BeOS running on a $300 PC for themselves.

5183. Atari SF354 Floppy Drive Problems...

Newsgroup: comp.sys.atari.advocacy
Date: 2000-03-16 00:00:00 UTC
From: Eric Henneke <ehenneke@ev1.net>
Message-ID: <tFaA4.6564$511.1795081@tw11.nn.bcandid.com>
Source record: 1802

I have 2 SF354 floppy drives for my 520ST. One of them still works
perfectly fine.

The other, however, is getting power, but doesn't seem to spin at all.

My assumption is that there is probably a belt in the drive that either came
off or snapped, or is stretched or something.

I opened op the Atari casing, to find the internal floppy drive assembly.
Unfortunately, no drive mechanism or belt was accessible. I messed with
trying to open the internal drive case itself, but I didn't want to force
anything that wasn't supposed to be opened.

I am hoping that somebody can walk me through this and let me know how to
get to the portion of the drive I need to access. Or, maybe this is
symptomatic of another problem that has a well-known fix.

Finally, is there somewhere that I could just get a cheap replacement for
the internal drive that would just plug right up to the power and controller
card in the SF354 case? I'd rather just fix the one I have, but this may
be a last resort.

Here are the specs of the drive (since I know they vary widely):
SF354
Serial #: A1645010549
Made in Taiwan
FCC ID: EBA72RSF354
It's the SF354 model where the red light in the front is on the lower right
corner, and the disk slot / eject button are "slanted" to match the
esthetics of the ST computer.

Let me know if you may be able to help me out. If there are other details
about the drive needed to make a diagnosis, let me know and I will provide.

Thanks in advance to anybody who can help!

-Eric

You should be able to replace the mechanism with a standard
PC floppy drive. I ran my last STe with a 1.44M floppy quite
successfully.

Ah, but the question was speed, not price.

I love BeOS, but really don't care for PC hardware. However, Mac
hardware is overpriced, even second-hand.

Then a Milan is certainly going to be out of their price
range. Furthermore, it IS quite feasable for a kid to
have $300 to blow. That fact is the only reason I was ever
able to buy myself an Atari ST in the 80s.

>enough to purchase a Celeron? A waste of money as far as I am concerned.
>Get a Mac if you want speed and relaibility. Get a PC if you like self
>torture.

You are absurd. On one hand you whine about how some target
demographic wouldn't be able to buy a $300 computer and then

turn around and suggest that they buy systems that START at
$1200 and go into the stratosphere from there.

Beyond the CPU there really isn't much difference these days,
actually. A modern Macintosh is pretty much just another PC
with a PPC chip in place of a Pentium.

It all depends on what you're running. This is why an 060
could even be considered. PC hardware doesn't require
bloat, it just tends to be bundled with it by default.

Hello,

I search of documentation on the structures of file RSC. I created a program to extract the icones from 2 to 256 colors of the files Windows ICO and CUR (files DLL, EXE and OCX in progress). I would like to record them in a file RSC with format CICON. The documentation which I have (Compendium, Atari developor divides into volumes 1 and 2) are a little light on this subject. I saw well the structure RSHDR in PURE C, but no documentation on the pointers of objects. I believed to understand that there was a file RSCREATE.C which would seem well to answer my request. Can you help me to find it. Thank you by advance.

Just like the Mac games you mentioned - let you fingers do the walking. All you have to do is just scroll down the lists and compare the same game titles, when you can find a Mac game, and compare the prices.

Now I did acess cnet using my TT - so maybe my computer has a built in bias.....

CivCTP and SimCity 3000 would probably be a good start.
Starcraft is probably at least $20 more for the Mac
versions these days too.

[deletia]

Mac release schedules are far enough behind (Linux and Be too)
such that by the time a title is out for a non-win32 platform
the win32 version has started it's discount cycles already.

Seeing as I only have to boot it up once or twice a day this isn't really an
issue for me.

> What do you do while you wait for your PC to boot up after a crash?

See my reply to the first comment.

> What do you do while you wait for 10mb applications to download?

I buy one of the many PC mag's with a coverdisk that contains heaps of PC
software.

> What do you do when you find out your 200 mmx is slower than a Milan
> 060?

My P233MMX with USB is worth about $150. How much is a new Milan?.

> You buy an Atari Clone.

No. You buy an outdated '060 Atari clone because you love the platform and
don't at all care for the fact that faster, cheaper and well supported PC's
are available.

When you buy an Atari clone it is definetely not a choice based on a
performance figure, but rather an expression of individuality and personal
choice. Same for all the other minority platforms.

MiNT is there any support left for then ?
NAES is specifly designed for the atari to remove their design flaws !

> What do you do while you wait for your PC to boot up?

On my atari I had to use a boot manager that cost time too. And if I was dumb enough to install another OS it wouldn't take as long. At least I have an OS which supported by millions of recents programs instead of a few hundred. (hundred that is kind friendly of me)

> What do you do while you wait for your PC to boot up after a crash?

Oh yeah , and all those beta versions of atari OS-es don't crash.

> What do you do while you wait for 10mb applications to download?

Just enjoy of browsing with Netscape anc chatting with Mirc , knowing if I don't like these programs I can choose out at least five other programs to chat or to browse. I just download the Halflife OF demo (about 70 MB) and didn't regret. At least I have the choice.

> What do you do when you find out your 200 mmx is slower than a Milan
> 060?
> You buy an Atari Clone.

In what becoming obsolete ?
Serously the motorola 68060 isn't faster than a intel 200 mmx. Its a common misunderstanding under atari users. Read a good book about computer architecture and you'll know. A good book would tell that the motorola series was about 2 times as fast.
as a 486 comparing to clock speed. (that means a 486dx100 is to compare with a 68040) But... , this doesn't count for the intel pentium series because they a much improved architecture. Taking in respect that the motorola has a better FPU , you can compare it with a pentium 75 or so and the over clocked 68060 at 120 MHz to a pentium 150.
But with bigger programs it is even worse for motorola because of the outdated 32 MHz external bus comparing to the 66 Mhz bus of the 200 mmx. (Big programs need to acces the memory chips a lot more)

The CPU is where it amtters and RISC technology is inherently
faster and better, so PPC is indeed better than Pentium.

you are not making any sense.
limited in the sense that the supply of ataris are limited(no onger
being produced?)
or limited in the sense that there are only a certain number of
musicians to go around?
or limited in the sense that there are only so many intelligent people
alive at any one time there fore the market for ataris is limited to
this group?

what, in your definition, is a limited market?

No it isn't. A PPC clock for clock, using non cooked
benchmarks is about 20% faster clock per clock than
a PIII. However, you can get a twice clocked PIII or
K7 and get one in a complete name brand system for
about the same price as (half clocked) Apple system.

The IA32 has economies of scale on it's side. Intel
has competition from AMD to keep it from dragging it's
feet too much. Whereas Apple has always been happy to
gouge you by charging 2x as much for the same parts as
others sell.

BTW, the K7 has 'all of that RISC goodness too'. So do
the sparc and alphas. Even those still manage to deliver
more bang for the buck.

so what you are saying is that you can buy two or three times as much
shit for the same price as something quality. sorry, shit is still shit,
no matter how much of it you have. Unless you are someone who thinks
lots of shit is better than no shit.

> >PC stuff is dirt-cheap or free because it is obsolete even before

obsolescence is a factor though. When the software you bought a year ago
is no longer supported
because they have new versions out that only run on the 'newer'machines
and you can't afford to upgrade both your machine _and_ the software but
you need to upgrade the hardware again because of this shiny new
software you just have to have cuz it is so kewl but then your other
software runs funny or...
Do not confuse real obselescence which Martin was not talking about with
'marketing'manufactured
obsolescence which he was.

you are the one looking foolish.
pay attention! (or are you just trolling?) to quote above "Second-hand
Atari hardware..."
now does that resemble *new* Milans?? In terms of MIDI software 15 year
old Atari's are as good as it gets. deal with it. do you have some

fetish about progress? that newer _has_ to mean better?
n o t. if that were true then MIDI timing on a modern Celeryon would be
beter than Ataris timing, but it isn't.
Milan has absolutely no appeal for you at all, so how can you judge what
appeal it would have for others??

> --
> |||
> Resistance is not futile. / | \

perhaps this is not true in your case.

That's a nice fantasy and all. But you really are quite out of
touch. Except for serious Unix RISC machines, all PCI based
systems are essentially the same sort of crap. This is especially
true for Milans and Apples.

The Milan at least has the benefit of an OS optimized for running
on obsolete hardware. The Macs don't even have that.

>no matter how much of it you have. Unless you are someone who thinks
>lots of shit is better than no shit.

I don't need to be restricted to some overhauled DOS. Thus I can
get quite a bit of quality use out of a cheaper 400Mhz machine.

No it isn't. Either it does it's required task or it doesn't.
Software doesn't wear out. That's why we had all of that Year
2000 BS. Effective software can keep running for decades. I
could still get quite effective use out of a 1993 copy of Amipro
if I really wanted to.

Yes. I actually like being able to run in 1600x1200 in 24million
colors, do video capture and overlay, download spiffy sorenson
media and convert it to cinepak (so I can play it natively), and
exploit 3D acceration hardware.

>n o t. if that were true then MIDI timing on a modern Celeryon would be
>beter than Ataris timing, but it isn't.
>Milan has absolutely no appeal for you at all, so how can you judge what
>appeal it would have for others??

Actually, I wouldn't mind having access to a reasonably priced
Milan motherboard. Most of what I run is available as source so
I'm quite flexible.

Although, being 'just another PC' it would likely have the same
problems as a WinTel PC would with MIDI. Then again there is Be,
specifically geared for realtime and audio production. You're
just too obstinant to try it, even to just get enough to of a clue
to criticise it from an informed point of view.

[deletia]

That's foolish.

let me say that EVERY operating system is designed to remove 'perceived
flaws' in previously
existing operating systems. Name ONE that isn't!

>
> > What do you do while you wait for your PC to boot up?

you used the boot manager IF YOU CHOOSE to. where is the choice with PC?

At least I have an OS
> which supported by millions of recents programs instead of a few hundred.
> (hundred that is kind friendly of me)

no. hundred is being unknowing, or maybe you think sarcastic?? must be,
you say millions of recent programs. not very factual. but true there
are more programs for PC, this is because there are more users.

> > What do you do while you wait for your PC to boot up after a crash?
>
> Oh yeah , and all those beta versions of atari OS-es don't crash.

you do not mean TOS. Mike was not saying that Atari do not crash. He was
comparing performance between both systems after they had both crashed.
If your atari crashed, was it hard to restart? was there a lot of
damage from the crash (i.e. trashed hard drive)? compare this to PC in
my experience, not second hand info, not rumours, my own experience,BIG
problems sometimes after Windows crash. like no hard drive left, toss it
in the garbage heap.
this is very funny eh?

> > What do you do while you wait for 10mb applications to download?

> didn't regret. At least I have the choice.

ok, well have fun with your choice. hope you have the hard drive space
to store it, the system resources to run it. there is more choice on
windows, yes. I have been looking for a couple of weeks for html
software, many programs out there, many many more than Atari. still,
hard to find a good program, one that I can use, that writes good code.
I use an atari emulator to run Edith and qed so that I can iuse kurzels
to write html code by hand. not pc programs can do this. oh yes, you
have so much choice.

> > Mikey
>
> Greetings Erik Karsies

Of course a 200MHz intel is much faster than any atari built yet, faster
than a Milan sure.
The hardware.
now, in the real world we have operating systems. You do too. put
windows on a very fast intel chip. you have a much slower computer for
the end user.
now, you put magic or mint on a 68060. you have a fast computer. faster
than your 200 mmx intel seems for the user. Who cares is you have all
that power if you never see it? don't feel it?

you say big programs need to access memory chips a lot more. true.
but you only have BIG programs in windows on intel because they have to
code so fast for the market they write big fat slow programs. or maybe
they have to match the big fat slow os.

ken

>
> Any attempt at intelligent communication with the sinclap
> will fail miserably, as it has no ability to comprehend!
>
ah, yes. But, since you are such an expert on the workings of the
sinclap Random String Generator (to be referred upon as the sRSG), maybe
you can answer some questions I have on it:

1) years ago, it was being referred to here as the sinclap Random
Bull**** Generator. Is the sRSG an improvement upon the older sRBSG, or
is it a completely different program from the older program? If so, what
improvements have you noticed being done between the original and the
one we see today?

2) it's been rumoured that the sRSG is running off a Macintosh
computer. Why would anyone program an application of so non-existant
importance for a respected platform like the Mac? And is it true that
previously it was designed to run on an Amiga?

3) about two years ago, the sRSG began suddenly spouting out nonsense
attacking a supposedly portly individual called "Chunks". Since this
said "Chunks" has been proven not to exist (he is certainly not on the
rolls of TAF), what variable could have caused the sRSG to mutate itself
to generate attack strings against an imaginary individual?
Is it a mutation of a similar bug in which it claims that imaginary
"Atari Jihads" are "out to get it"?

4) what about these rumours I'm hearing that the sRSG is actually a
subset of an even larger program called the Steve Jobs
Reality-Distortion Field (tm), being run from a large NeXT machine in
the basement of an anonymous building in Cupertino, California, USA. Is
the sRSG affected whenever the SJR-DF program crashes, or when the main

program spouts out similar larger amounts of gibberish that have an effect over a wider area of the population?

5) the sRSG seems to have a problem when it generates its messages in that it is unable to piece together coherent sentences, and mangles the spellings of common everyday words. What are the chances that this obviously glaring flaw can be fixed?

6) the sRSG has taken to pulling articles from web sites and pasting them (badly formatted) on USENet groups. I notice recently that whenever a Canadian replies to it, it has been pulling articles from the National Post website to say how bad we have it in our country. We suspect that the website (and indeed the hardcopy editions) are being polluted by the "Tubby Black" virus. Could the TB virus be a mutation of the sRSG in larger form, and is the sRSG be itself a worm virus? Why has the sRSG been so attracted to the NP website, especially in light of the fact that the other Canadian newsites which have not been affected by the TB virus have been reporting the exact opposite? (We also find it interesting that the NP web site has not reported that a certain newspaper baron much unbeloved in this country recently had his lawsuit against our repected PM thrown out of court, and that indeed it has once again gone to new heights of screeching against the PM - symptoms eerily similar to the sRSG in dealing with any USEnet posts that contain the word "Atari" or "TOS")

I await your respected opinions on the above queries.

We use 64 meg, P233's at work, running Windog NT, and I'm here to tell
you that they are slooooooowwwww...

In fact, my Nemesized Falcon running MiNT felt much more responsive.
This is from first hand experience, so I can just imagine how much
faster an 80mhz '060 Milan running MiNT would feel! ;-)

Good Answer, because this is the nature of the market today. Using other
platforms such as Atari, we focus on economies of Scope.

Exploitable economies of scale.

Wouldn't have thought to use that first word. Sums things up perfectly.

Brian.

Stuff gets cheaper when you can sell 50 million units.

Stuff gets cheaper when there are multiple sources each
applying competition pressure on each other.

The 68060's themselves probably cost an arm and a leg. 680x0's
have always been relatively more expensive than similar x86's.

600Mhz Athlons are about $800 these days. So it is quite likely
that you could get an adequately performing (under NT5) PC system
for as much as a Milan goes for.

That's not surprising. NT is the least responsive PC OS I can
think of. That's why I suggested that people take a look at
Be. Linux is also more responsive (than NT) but it's still rather
bloated in comparison to GEM and is not optimized for hard realtime
(like Be). Plus, a musician might stand a better chance of finding
suitable apps under Be.

Point being that for the same price as a new Milan, you can buy PIII which
blows an '060 away.

Question is: Are you judging speed only by perceived OS responsiveness and
not pure number crunching performance?.

This thread seems to be going in circles ;-)

Why, then, are RISC chips moving away from pure RISC (one size for
everything, one way of encoding instructions) towards something more
CISC-ish? (Variable length instructions, more than one instruction in
one instruction word)

And why are CISC processors moving more towards this same target? Even
the Pentium is abandoning the "everything is a multiple of 8-bits"
philosophy, and moving towards the "multiples of 16 bits" for its
instructions, data etc (I cannot recall when this is supposed to
happen, though - perhaps in the 5+ years overdue 64-bit x86 [aka 80686,
"686"] scheduled to appear in 1995)

IF I CHOOSE ??? ;) I'm speaking as former atari ST user, maybe for later models it isn't that bad, but I really needed the boot-manager because I didn't want to copy things in and out of the auto-folder every time I booted up.
If I choose to boot up on MS-dos partition it boots up in a about a second or two.Windows 98 is booting up much slower thats true , but one of the reasons is not windows but all the other programs which are started and the beginning too, and customized icons and the drivers for all kind of hardware you can't run on an atari.
And there a some very easy speedups you know like defragmenting once in a while.
I hope you not refering to a rom-based OS. Because history has proved that isn't vey handy to have a OS in roms.

> At least I have an OS

Huh, no hard drive left ? This is highly inprobable, tell me how it happened and probably if you do the samething on an atari OS it will happen too. Didn't install a virus protection ???? (That is a real disavantage of much used OS :( )

Second-hand information? Of course, you mean the cute little bombs ! (sorry I'm sarcastic here) If you would know windows better, than you would know that all kinds of utillities like DR Watson , scandisk and a bootlogger to detect what the problem is

> toss it
> in the garbage heap.
> this is very funny eh?

The worst thing that can happen is that you have to format the hard drive again, Still annoying, but if the USER does something wrong it can happen on a atari too.

>
> ok, well have fun with your choice. hope you have the hard drive space

> have so much choice.

Huh, ever hear about notepad ?????(and the hundreds of replacements). I know a diehard HTML-er which use this programmy for more than 3 year in a row now an. Or even dosedit in window is possible !

> > > What do you do when you find out your 200 mmx is slower than a Milan

...

>
> Of course a 200MHz intel is much faster than any atari built yet, faster
> than a Milan sure.

Thanks for saying that. Mikey was stressing otherwise. So Mikey, I hope you are reading this.
On what proccesor based?, the 68060 was build to compete with the low end pentiums and there never been a new one to compete with the new processors.
I don't expect that atari/jts will ever release a computer again. So is right to still call a not 68xxx based computer a atari then ?

> The hardware.
> now, in the real world we have operating systems. You do too. put
> windows on a very fast intel chip. you have a much slower computer for
> the end user.

> than your 200 mmx intel seems for the user. Who cares is you have all
> that power if you never see it? don't feel it?

The only fair comparision is linux and that doesn't run faster. (I've checked this out)
There are faster OS's for the pc you know. And how many drivers do there exist for Mint and Magic ? Any 3dfx support yet ? Or a driver for you're ordinary PCI sound card?
And I think it isn't fair to compare a OS with a lot less functionality in it with the speed of windows.

> you say big programs need to access memory chips a lot more. true.
> but you only have BIG programs in windows on intel because they have to
> code so fast for the market they write big fat slow programs. or maybe
> they have to match the big fat slow os.

New Linux programs most of the time are even bigger. Programs get bigger because company spend much time making it. Thats not wise for an atari developer is it ?
For your information, there are for example browsers for windows which are a lot smaller , but they don't have the functionality of Netscape. You could call a new Atari program/OS big too comparing to a 8 bit, but you have admit the new programs are better don't you ?

Greetings
Erik Karsies

5216. the Sinclap random string generator explained!

Newsgroup: comp.sys.atari.advocacy

> improvements have you noticed being done between the original and the
> one we see today?

Well-observed. You're absolutely right. Several years ago it
carried the title of BS generator, but since it is evidently
also capable of generating sentences of extreme hilarity (for
their pointless views and mis-interpretation of everything),
it's more appropriate to describe it as a random *string*
generator. Those strings may, of course, also contain character
and word combinations that when interpreted according to a
particular set of language rules, means plain ol' BS. They may
even produce beautiful music if loaded into a sample player
(see Danny McAleer's "Audio ABCs" article in Atari Computing
issue 4, page 21).

This is a close analogy to the theory that a group of monkeys
with typewriters and infinite time, could produce the entire
works of Shakespeare. They would also produce lots of BS and lots
of instances of "Atari" and "TOS" but not necessarily in a construct
of any meaning.

To summarise the principal differences between the old sinclap
BSG and new RSG is simple: The new version is multi-threading,
for those really wicked pranksters with high-end workstations,
and in terms of its functioning, it has developed a large degree
of artificial stupidity.

> 2) it's been rumoured that the sRSG is running off a Macintosh
> computer. Why would anyone program an application of so non-existant
> importance for a respected platform like the Mac? And is it true that

> previously it was designed to run on an Amiga?

The sinclap algorithm was originally developed at Berlin Technical University by a doctor whose name escapes me at this moment. Like any logical algorithm, it may be adapted to execute on any digital computation system, so modern computers are an ideal hosting environment to thrash the sinclap String Engine (not to be confused with Sony's PlayStation 2 Emotion Engine, an infinitely more exciting and useful thing).

Like a virus, the sRSG got to spread and evolve/reproduce in many ways. Some are malicious, some are purely academic (it's one of the UK's top 3 Computer Science final year project studies, and one hardcore German computer magazine even published C sources so readers could program their very own sinclap Random String Generator).

So the sRSG exists on many platforms, and perversely, with Apple's new super-duper G4 "Supercomputer" machines, its high CPU demand makes it an ideal benchmark for the latest generation of high performance microprocessor cores. Some old benchmarking programs would suffer severe internal integer/FP overflow when executed on new CPUs and MPP (Massively Parallel Processing) arrays. It would be interesting to see how the score of 3.2 sinclaps on a 500MHz G4 would compare to the million-processor research machine currently in development at IBM. It could well smash the magical 1 TERASLOPS (trillion SincLap Operations Per Second) barrier, not accounting for compiler optimisations.

> 3) about two years ago, the sRSG began suddenly spouting out nonsense
> attacking a supposedly portly individual called "Chunks". Since this
> said "Chunks" has been proven not to exist (he is certainly not on the

> to generate attack strings against an imaginary individual?

Pure co-incidence that the random output at that time appeared to have a negative bias towards the imaginary "Chunks".

> Is it a mutation of a similar bug in which it claims that imaginary
> "Atari Jihads" are "out to get it"?

Not a bug at all, see above.

> 4) what about these rumours I'm hearing that the sRSG is actually a
> subset of an even larger program called the Steve Jobs
> Reality-Distortion Field (tm), being run from a large NeXT machine in
> the basement of an anonymous building in Cupertino, California, USA. Is
> the sRSG affected whenever the SJR-DF program crashes, or when the main
> program spouts out similar larger amounts of gibberish that have an
> effect over a wider area of the population?

No. A larger and more processor-intensive program than sinclap RSG could not possibly run at a sensible speed on those NeXT boxes, unless someone has worked out a way for it to invade and multiply

on networks, and be able to pass parameters between processors
without consuming so much network bandwidth with its remote
process initialisation that it becomes even slower to run it on
distributed processors.

> 5) the sRSG seems to have a problem when it generates its messages in

Afraid I have to add sixpence worth here...

Your labelling of Milan as 'obsolete hardware' is just a little tongue in cheek am I correct? The Milan represents what is top-of-range for an Atari user, so how can it be obsolete? Yes it uses PCI and other tech that have been around the PC/Mac world for some time, but the key issue is that these technologies have not been used much previously in the Atari world. That world is completely removed from the world of PC/Mac, so what is labelled redundant or obsolete on PC/Mac is not necessarily so on Atari don't you think?

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

In that case, Atari is an even more potent market than Amiga.

Sure, until you want to run the latest games, play or encode MP3's whilst
doing other things, DVD, render some stuff, emulation... you get the
picture. There are plenty of different OS's available for the PC so you're
not just limited to Windows.

> and if the hardware catches up? WATCH OUT! smell those burning
> synapses?? :-)

Yes, if it catches up. A 1Ghz Athlon is somewhat faster then any '060 though
;-).

Be is a bit behind. They only just got CivCTP. But Linux has
Unreal Tournament, Quake3, Heavy Gear II, Heroes of Might &
Magic III, Railroad Tycoon II Gold, Myth II, CivCTP with
Solder of Fortune, Jagged Alliance 2, SimCity 3000,
Alpha Centauri, Shogo & SiN in development.

Shogo & SiN are also being ported for the Amiga.

We're also talking about the Milan... an 060 that goes for
about as much as a new K7/600 system tends to go for these
days.

[deletia]

The Falcon or TT hasn't really ever been as 'new' as it gets.
Cloning or 3rd party upgrades have always been around.

So it represents 'top of range for an "Atari on 0x0 user'.
Considering that even under emulation, a much faster PC or Mac
likely has cycles to spare: a Milan is probably not the absolute
top of the line when it comes to running GEM 68K binaries.

Nope. Low resolution and low color with limited expansion options
is no less that even if it is the best you think you can manage.

Get out of your fantasy land. Intel and AMD are pushing
each other harder and harder to increase their performance
and lower their prices while Apple and Motorola just sits
on their laurels.

The benchmarks that do show a significant performance advantage
to PPC's are quite cooked and a mostly a product of apple marketing.

Even if you accept the notion that clock for clock a PPC is thrice
faster, you can still build a thrice clocked PIII that will be
price competitive with Apples.

Besides, the K7 is indeed a RISC core. So blind faith in the
relative utility of RISC doesn't really necessarily tell you
anything in a K7 vs. G4 comparison.

The only catch with that is Kludge Klones can still deliver
2x or more cycles for less, even buying name brand hardware.
Plus you'll have better options and components available and
possibly get onsite support to top it off.

Actually, the Amiga's custom hardware imposed some pretty
heinous engineering limitations. The ST wasn't quite as
'blown away' as you indicate. Although they (ST/Amiga) both
made the PC's and Macs look bad.

reality check
last time I looked, I was running in true colur at 800x600 on my Falcon.
I would think that the Milan2 could be doing (easily) 24bit colour at
1024x768.
you refer to this as low resolution and low colour?
PCI, ISA, USB, PS2, SCSI, IDE: this is limited expansion??
motherboard by Motorola.
now in emulation, yep, very few over 640x480x16.

The Milan can go as high as whichever PC graphics card you put
in.

> now in emulation, yep, very few over 640x480x16.

Indeed. All current emulators emulate a slightly more colourfull
version on the STE, at best. TT and Falcon enhancements have
never been emulated.

You two are still talking about 1/4th the resolution I
mentioned and not necessarily as much colordepth and that's
not even the extent of what current PC/Mac video hardware
can do.

You don't, but the Milan does. That graphics card is very much a
standard Trio S3 card initially made for the PC market. Drivers
for other manufacturers' cards are also written for fVDI.

Such as?.

The ST wasn't quite as
> 'blown away' as you indicate.

I couldn't get over the fact that the ST had standard MIDI ports (which
didn't interest me) and a shithouse, half arsed Yamaha soundchip (sound
reproduction did interest me). Amiga was far more impressive for me at
least, and I sold my ST.

Ofcourse, people's experiences will differ.

Although they (ST/Amiga) both
> made the PC's and Macs look bad.

That wasn't too difficult at the time though, then again, MacOS is still
handicapped.

Regards,

Clockmeister.

My opinion of the S3 Trio is that it has great output, but shithouse
performance.

I hope the video card/driver situation improves for the Milan if the S3 card
is the standard unit.

Then it's rather peculiar that the Milan website doesn't
mention this. One would think that they would want to
cast their system in the best light possible while still
remaining truthful and quite possibly verify compatibility.

There doesn't seem to be a horribly long support list for fVDI either.

obviously you have never been to the Milan website, check this out:
http://www.milan-computer.com/gb/products/milanII01.html
which among other things says:Hardware

ATX-Tower
MC68060 with at least 66Mhz, 80Mhz is under
construction
64MB-SDRAM (with full Bus-speed access at
66/80Mhz)
Harddrive of 10 GB
SoundBlaster SB64 PCI
ATI Mach 64 with 4MB Videoram, expandable up to
16MB
2x IDE, 3x serial, 1x parallel, 2x USB (hot
plugging!), Keyboard, PS2-Mouse
3x ISA-Slot, 4x PCI-Slot (2 PCI used for graphic-
and sound card)
TEAC Floppy 1,44 MB, 40x CD-ROM (Cyberdrive)

> There doesn't seem to be a horribly long support list for fVDI either.

in comparison to...?
fVDI is coded by a single individual, I am blown away by what he has
accomplished so far.
That he has any support list at all is amazing. and that he is working
with a commercial developer is astounding!!

ken

That says Mach 64 a lowend ATI chipset, not Trio a lowend
S3 chipset. Furthermore, their listing of supported expansion
hardware lists nothing.

>Your point is what?

You still get more bang for your buck with PC's.

If your computing is userbound, you can massively undercut
Apple pricing. If you need more computing horsepower, you
can still undercut Apple pricing and beat Apple in total
speed as well.

If you need MUCH more computing horsepower, you can just
get a 4-way or 8-way SMP PC if cost is no object.

Milan 040 used a Trio S3. The info should still be somewhere on
the web site.

I don't believe freaks is meant negatively. Perhaps the term techies
could apply. But really, people looked upon it as a cool games machine
and a fun computer.

>> >>
>> >> Actually, the Amiga's custom hardware imposed some pretty

>Serial speed, not CPU speed.

Serial Speed, and CPU speed. I had to endure to many instances of just
that. These limits as I have mentioned before, could occur even in LOW
Resolution on an A3000 at 16*320*200.

More objects in motion on the screen the more the timing became
unsquenced and the # of fps would reduce from 32 to a little as 14
depending on the Animations complexity. The 8 mhz ST running in the same
resolution maintained 32FPS.

So moving to the higher resolution at that time for realtime animation
was dropped in favour of single frame recording to laser disc.

Here in my hands is a written copy of Apple's latest 10K public report which is provided to all shareholders...Of course the share price is upto an all time high of $141 thanks to news that the company has added another distributor..

The report discloses that Apple shipped 724,000 units to Europe...Much higher than the 50 unit sales per month of the Milan. The sales more or less crushes the myth that Atari ever had that many units at once on that continent...

sinclap!

If you buy cheap, you get cheap! In comparison to PC's, Mac's are bulletproof. Part of my time involves supporting PC's and PC applications and I won't run anything at my shop or home that isn't Mac (excepting the Proliant server I've just put in).

With the exception of systems that are left as is and sidetracked from the neverending cycle of updates and bug fixes (that seem to propogate two faults for every one fixed) PC's need a constant cysle of support and maintenance. I have Mac's at the shop now that are hardly ever rebooted and haven't needed attention for three years now. My kids get a game, put it in the CD and play. My friends get a game, the kids try to install it, toast the system and then bug me. The registry is so fragile.

ROTFL!

Sinclap, you really _are_ an idiot. That's less than 1 million.

Try guessing how many _bi_llions of Pentiums are in Finland alone
or even in Scandinavia. Hint: several orders of magnitude more
than the total number of iMacs shipped to the whole Europe.

I certainly know that overall graphics speed takes a hit when using higher resolutions, but didn't think it actually affected CPU speed. I certainly hadn't noticed.

The serial speed problem is pretty well known (although there are workarounds).

If I am wrong, I apoligize ;-)

To be realistic about this MOST PC owners today have a gfx card that
supports 1024x768 resolution or bigger, but MOST of those will be viewing
that on a 15/17 inch monitor that doesn't support much higher than that.
On a 17 inch screen rez above 1024x768 are beginning to look a little
bit hard to read. 1024x768 is ample for MOST applications. You have to be
a fairly serious gamer/gfx designer, or just plain silly to use bigger...

> No it can't. I doesn't support any PC graphics cards at this time.

Eh? ATI Rage Pro seems to be sold for PC's still. Just because Nvidia and
VoodooIII are pushing the market currently doesn't mean that lower spec
cards are no longer available. ATI are not viewed as a brilliant card
maker for PC (Voodoo and Nvidia sell better), but only because those
companies use a little more glitz and glam in their PR...

Milan will use those cards provided drivers are written...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Considering that 19" monitors are now in the $300, this
sort of assumption is rather silly.

>On a 17 inch screen rez above 1024x768 are beginning to look a little

Even under X, most applications aren't that inflexible. Most
applications will gladly take advantage of fonts up to at
least 72 points.

If a Rage Pro can easily exploit the current Milan2 Mach64
driver, it's maker doesn't seem to be very confident of
this option. The notion that the Milan2 can't deal with any
other vidcard comes straight from it's webpage.

>maker for PC (Voodoo and Nvidia sell better), but only because those
>companies use a little more glitz and glam in their PR...

No. ATI performace is always quickly eclipsed by the rest of
the market. What ATI is is a nice cheap OEM part that gets
pushed on consumers.

>
>Milan will use those cards provided drivers are written...

...that's vapourware.

Mind you, you could download the Banshee/Voodoo3 2D register
spec right now from 3dfx.com and start cracking... The V3
even comes in a PCI variant for systems lacking an AGP slot.

[deletia]

Even that's not entirely true universally. Although, AltOSes
do tend to be lacking when the specification is to support
some arbitrary 'AppFoo' rather than just a particular task
or filetype.

In French, there is an expression "consomateur avertis" (loosely translated "smart shopper") which clearly describes a species we have seen disappear over the last 6 years.

Not only are consumers not smart, but I.T. professionals as dumb and fashion-savy as it gets, so whenever someone gets told that Windows95 is needed, no one questions it, just like they never question the wisdom of their politicians anymore.

Basically, the only reason why Intel and Microsoft are winning this is because nobody bothers shopping around town and see what alternatives there are. In another thread elesewere, one thing that struck me about the 80's is that there was variety and the people actually took the time to select what seemed to suit them best for their field of application. Not anymore. Such a pity.

No, a Milan motherboard kit isn't expensive at all. And you surley never purchased a "new" Atari in the mid 80's for $300.00. IF the purchaser uses existing TOS based applications, the Milan is a smart investment IF the software they currently own serves their purpose. Sure, if compatibility with other platforms is an issue, move on, but to change for the sake of purchasing a platform that can run Mac O/S or Windowze, that would be a crime. TOS applications on a TOS clone will out perform their counterparts on the slower systems that you are talking about by the length of most European countries. Benchmarks don't tell the whole story here.
>
> >enough to purchase a Celeron? A waste of money as far as I am concerned.

> demographic wouldn't be able to buy a $300 computer and then
> turn around and suggest that they buy systems that START at
> $1200 and go into the stratosphere from there.

Right,you don't see your irony? Why shouldn't an existing TOS user purchase a TOS clone to upgrade their computing performance. What I am suggesting is the very same performance that can be had by purchasing a low end PC or Mac can be obtained using their existing application collection on a Milan TOS clone. There are exceptions like floating point calculations and benchmark applications, and if your into benchmarks, by all means purchase a PC or Mac. If you want a decent, stable multitasking O/S, go with the TOS clone. You surely won't get that in the Windows or Mac O/S market. I'm not sure where your experience comes from other than your presence in this newsgroup. I have experience working with PIII's, G4's in a "work enviroment" and they do manage to get the job done. I am very glad I am not the system adminstrator in our lab however. My 50Mhz 030 running MiNT and NAES runs rings around the multitasking ability of the Mac and Windows O/S. My 40Mhz 040 betters that by 5 fold.
Hey, all that glitters isn't gold except in Bills pocketbook and those of Apple investors. MiNT isn't perfect, but at least it is updated near a monthly basis, not some hype that will be released next year with some stupid name like "Windowez 2001"," just as vague as the motion picture" and just as dated. I don't really give a shit for your opinion, Atari user or not, and am surely not threatend by a professional debator such as yourself. You spend much to much time defending the obvious.

i use Macs at work professionally and my Amiga at home for entertainment.. my boss stuck me with pulling two 5 and 6 meg Filemaker DBs off the 20 meg hard drive of some clients Mac "classic" (or whatever they call that little thing with the 5 inch monochrome monitor built into the computer, the telephone wire connecting the keyboard and the mouse so unergonomical it actually hurts your hand to use it) but it has 1 meg of RAM and is running System 6.1.. thats 512k more than i had on my A500 when i first got it, running WB1.3 which is a hell of a lot older than System 6.. all i have to do is transfer these files from the HD to one of our Power Macs so that i can update it to Filemaker Pro 4 (right now its Filemaker Plus v2.0).. well to make a long story short i have been here since about 10 last night and it is now 1 in the afternoon the next day (i only expected it to take about an hour).. every splitter/joiner i found thats still compatible with System 6 crashed because the OS takes up so much memory it only has about 200k to operate in.. every compressor also crashed under similar circumstances.. my attempts to connect the HD (its an external SCSI) to one of our newer Macs failed because of the old filesystem.. as did any attempt to connect a ZIP or MO device to the SCSI on the old Mac because it wont recognize the HD with anything else on the chain (regardless of ID numbers).. i was finally able to break the databases up into smaller bits that will fit on floppies - do you have any idea how long it takes for this Mac to omit 1000 records from a selection, much less export them?? however the last and biggest DB (all 6 megs) turned out to be corrupt so since about 10-11 this morning Filemaker has been repairing it.. i see that little stopwatch and the HD keeps blinking on but nothing is letting me know what kind of progress is being made - im afraid to restart if its locked up because the last time i did 2 megs of the HD mysteriously vanished and i can't get it back - that leaves about the same amount free of the 20..

i have used Macs with a fair degree of success and even enjoyment since about System 7.6.1 - but my god did they suck back in the day.. this system has to be at least comparable to the ST and A1000 as far as when it came out (the copyright on back says 87) - and 1 meg RAM was no laughing matter for any

system back then.. so thanks Commodore and thanks again Atari - thanks for making my life suck just a little bit more today..

venting but not feeling any less tired,

y'r pal -kK

Hello,
Come and enjoy the historical event "World of Alternatives 2000" on June
10
and 11 in Neuss (near
D&#65533;sseldorf, Germany), historical because during this expo Atari and
Amiga
will be under one roof !
Presented are the developper version of the Next-Generation-System
announced by Amiga and the revised version of the Milan II.
News about the (new, revised) Milan II can be found from 29-3-2000 on
the
Milan website http://www.milan-computer.de
Info about the expo from 29-3-2000 on http://www.atari-messe.de
Cheers
Dan
Milan 040 - Magic Milan

It's not an assumption, it's the truth. 19" monitors are only recently
becoming inexpensive. And 17" monitors are now in the $150 range, and
15" monitors are $100! Most people I know either don't want a 19"
screen because it's "too big" or they can't fit the thing on their
desk! Most people today use 17" & 15" monitors.

800x600 is perfect IMO on a 17" screen. I tried 1024x768 and it's too
freakin small. I'd have to tweak all the fonts and whatnot. I'm not
gonna press my face to the screen just so I can brag about my
resolution. Of course, you're not me. ;-) Only thing I know would be
better at high resolutions would be those cool 3D games like Unreal
Tournament or Quake3.

The ATI Rage Pro is a good card. I had one for 2 years before upgrading to a VooDoo3 3000. The ATI had more features and actually blew my friends away with the quality. I was very pleased with it. But that's beside the point really. Any card can be used provided there's a driver to run it. Milan will ship their computers with a default card - this is normal for computer companies. When the Milan becomes readily available, there will be more demand for other options. So it makes perfect sense to me that they only mention one card right now.

ATI is known for it's dependable (stable) cards, good support, and good quality & features. By no means would I say it's **the best**, but I would say it's a smart decision to choose an ATI card.

> >
> >Milan will use those cards provided drivers are written...

Yeah right. Just like the Milan is vapourware? Dude, just because something isn't released yet doesn't mean it's vapourware. Chill out, man.

19" monitors have been relatively inexpensive and available in
retail outlets for about 3 years now actually. They now just
happen to be cheaper now than 14" monitors were 5 years ago.

>15" monitors are $100! Most people I know either don't want a 19"

Fonts are meant for tweaking if you believe PC users.

>better at high resolutions would be those cool 3D games like Unreal
>Tournament or Quake3.

Even non-3D games are considerably better with a larger monitor.
This is why many people will put up with a lower resolution
console that they can use a cheap large screen TV with. What doesn't
have good console equivalents certainly benefits from a 19" or
larger monitor.

No it doesn't. They are trying to sell product. The more they
can say that product does, the better it makes their product
look. The fact that you could download the Banshee register
spec and code a Milan driver (rather than bickering here) while
potentiall useful, is meaningless until it actually happens.

The fact remains that you are claiming more about the Milan2's
capabilities than it's creators are.

While, strictly speaking, the Milan2 is still vaporware: what
you're peddling is vapor-vaporware. It's not even something
that anyone of any consequence is willing to make any future
claims on yet.

Hey TiFKAS - "vapour" this!

Yesterday Milan released quite a bit of information regarding the
upcoming milan ii. Ali Goukassian explains the new concept,
distribution plans, the new release date, appearence of the
machine and hmm, some more smaller details.
You can read the English version on MagiC Online:
http://bengy.atari-computer.de
Take care,
Bengy

Then that begs the question: why isn't there anyone that
can jump up and say "hey, I've got card foo running with it"?

Also, if the Milan2 is out already then why was the bengy site
talking about proposed case designs? That seems peculiar for
a product already released...

Where can one actually buy a Milan computer in the UK?

Or do we need to mail order it from Germany?

Rory

Mostly developpers in France and Germany, at the moment. There
are also a few customers who prepaid theirs months in advance and
got it at the same time.

LEGAL CABLE TV DE-SCRAMBLER

Want to watch Sporting Events?--Movies?--Pay-Per-View??

*This is the Famous R-O Shack TV Descrambler
You can assemble it from Radio Shack parts for about $12 to $15.

We Send You:
1, E-Z To follow Assembly Instructions.
2. E-Z To read Original Drawings.
3. Total Parts List.

**** PLUS SOMETHING NEW YOU MUST HAVE! ****
Something you can't do without.

THE UP-TO-DATE 6 PAGE REPORT:
USING A DESCRAMBLER LEGALLY

Warning: You should not build a TV Descrambler without
reading this report first.

Frequently Asked Questions--CABLE TV DESCRAMBLER

Q: Will the descrambler work on Fiber, TCI, Jarrod
and satellite systems?
A: The answer is YES. In respect to satellite,
you just get more stuff! There is one exception:
The descrambler will not work with DSS satellite.

Q: Do I need a converter box?
A: This plan works with or without a converter box.
Specific instructions are included in the plans for each!
Q: Can the cable company detect that I have the descrambler?

A: No, the signal descrambles right at the box and does
not move back through the line!

Q: Do I have to alter my existing cable system,
television or VCR?
A: The answer is no!

Q: Does this work with my remote control?
A: The answer is yes. The descrambler is
manually controlled--but very easy to use!

Q: Can you email me the plans?
A: No the program comes with an easy to follow picture guide.

Q: Does this work everywhere across the country?
A: Yes, everywhere in the USA plus England,
Brazil, Canada and other countries!

Q: Is this deal guaranteed?
A: Yes, if you are unhappy for any reason we will refund your money.

Q: When I order, when will I get my package?
A: We mail out all orders within 24 hours of receiving them.

Q: How much does it cost to get the instruction
plans, the easy to follow diagram, and most
important of all the "Using a Descrambler LEGALLY Report".
A: You get the complete 6 page report and instruction package all for just--$10.00

Q: How do I order?
A: Fill out form below and send it, along
with your $10.00 payment to:

CABLE FREE-TV
12187 S. Orange Blossom Trail #116
Orlando Fl 32837

(Cash, Check or Money Order.)

(Florida residents include 7% Florida State Sales Tax)

(All orders outside the U.S.A. add $5.00)

It's April, the G4/500 is available down the street, the Milan II may have gotten lost in the Atlantic. While the roll out of the Milan II is being dragged out, the other computer firms have moved on to the next big thing...

The Milan II Jihads were swearing up and down that the box would be available by March..Will folks it's April.....

Has Motorola fell down on the job, or is that producing 50 units per month is not worth while?

sinclap!

I am sorry Ken. You were too late. All deals expired April 1st 2000.
Luckily most inquiries came after April 1st, like it was April 2nd in
Europe and still April 1st here, and all the other inquiries, I simply

had to tell them I am lying!!! Its not forsale, it was typical April Fools Quackery.

However, there is actually more than I have listed, and if I were to sell it, I would sell it all for the price above and still be content. But I would have to be finished with Ataris, which I am far from doing just yet.

I am also waiting for the Milan II. I hope for a fall date, as this is when I start doing most of my Computing. But I have a difficult time letting my Ataris Go. My Friends would kill me, and I do donate a handful of Atari Set Ups each year to those who need them.

Later Brian.

hey great!!
i am glad you are not selling. I didnot see your mail until sunday,
so i didnot notice the april fool (that i am)!!
like you, i am waiting for the milan2.
i want the ATX case, so I can expand it.
good news it will be falcon compatible AND have MIDI as standard.
I should have the 1000$ or so by september also.
whoever gets one first has to demo it at a TAF meeting!!
ken

I guess the Mac G4 + FFCP are capable of the news broadcast at best. When will see "NYPD Blue" be taped in DV25?

-

CASE STUDY

The Making of The Shadow of Doubt

How indie filmmakers Cynthia and Geoff Wells produced a 2D animated movie using digital desktop tools.
by Jennifer A. Champagne

Almost everyone on Earth has an inner voice urging them to express themselves. On an artistic level, there are a number of ways to do that. Pencils, paints, conte crayon, and other mediums provide an eye-to-hand extension. Others want to express themselves in story-visually, at that. Enter the realm of filmmaking.

Filmmaking is among the most costly ways to express your creativity. And within filmmaking lies the genre of animation, another costly venture. However, in true independent spirit, the creative team of Cynthia and Geoff
Wells, who head up The Digital Theater Group, have shown that high-end animation can be done with relatively low budgets from within the home. They
set up a self-sufficient animation studio near Hollywood that consists of a
couple of Intel-based machines, some peripheral hardware, and-oh yes-an animation table.

When they decided to make The Shadow of Doubt, the follow-up to the award-winning Interview with Tallulah, Queen of the Universe, Cynthia and Geoff already knew the costs of animation production and the amount of time
it would take. They also were aware of the breakthroughs in digital technologies that would speed up this process; but until then, the cost far
outweighed the practicality. A lot of hardware and software had emerged that
would allow The Digital Theater Group to go into production without incurring exorbitant equipment or services costs. It was very important for

them to have the creative control of the project without the influence of outside investors. Therefore, the budget had to fit within the constraints
of a small studio and small budget. Every piece of software and equipment had to pass the "must-have" test.

In The Shadow of Doubt, a blues singer (Tallulah, pictured above) returns to
the Paris club where she got her start. While preparing to go onstage, she
is confronted by a ghost in her dressing room mirror. The ghost offers great
success and fame in exchange for ignoring the club owner who gave Tallulah
her big break. She resists the temptation and goes onstage to sing.

Cynthia and Geoff went through the arduous process of researching the products they would need to take the project from beginning to end while relying on as few outside services as possible. They already had the animation pipeline in place. Cynthia, a veteran animation director, created
the bulk of the animation. Volunteer animators, inbetweeners, and cleanup artists stepped in to assist Cynthia with the backbreaking work. In exchange, they received one-on-one training from Cynthia. The process of "shooting on twos"-creating 12 animation cels and repeating each to produce
one second of 24fps 35mm film-is standard for any animation studio producing
high-end animation (as opposed to Saturday-morning fare, which is often shot
in fours or even eights). At the time of this writing, there's no computer
or piece of equipment that will provide the 2D drawing. So where does the high-tech equipment come into play?

The digital ink-and-paint software was the first thing to choose. This, after all, determined the type of computers, the OS, the peripherals, the amount of RAM required, and so on. With a number of programs available-The
Animation Stand, Animo, Toon Boom, RetasPro-the couple ultimately decided on
Softimage Toonz (DV#203). Toonz wasn't the least-expensive piece of software, but it provided the necessary tools for Shadow and it incorporated
the proper analogies from the animation industry. Toonz utilizes exposure sheets, camera stand information and direction, and terminology that traditional animators use everyday.

To The Digital Theater Group, this transition from hand-drawn to high-tech
also had to preserve Cynthia's drawn-line quality. Because Toonz utilizes

raster-based scans and doesn't try to smooth out the lines by vectorizing them, the line quality was maintained to director Cynthia's satisfaction. The lines are also kept separate from the paint; so when the army of volunteer ink-and-paint artists stepped up to work on the project, there was
no danger of sacrificing line integrity. The DIP (digital ink-and-paint) artists merely had to go in, fill the areas with paint, and tint the lines.

This screenshot from Softimage Toonz shows the Camera Stand, the most powerful module in the Toonz program because it enables you to compose a 2D
animation scene in virtual 3D. While other programs let you preview from within the camera view, in Toonz you have to preview your work in Camera Stand in another screen.

This separation between ink and paint is a large part of the flexibility of
Toonz. Once the colors are laid into place, the art director can go back to
the painted animation and modify the colors. For instance, if a character has a standard palette but the lighting in a scene needs to be altered, you
would think that the character would have to be repainted. But in Toonz, the
colors of the paint can be adjusted, and the change is reflected in the entire scene. Everything painted with the new color will be adjusted on every frame. This added a lot of flexibility and malleability to the project, as elements could be easily altered late into production.

Toonz is not an inexpensive program (about $12,000 for the license, plus $2000/year for support and upgrades), but it passed the must-have test. The
investment proved worthwhile because it let them do the finished project properly.

Milling through the different operating systems for computers is always a (cue the sarcasm) joy because each company has its own agenda: to get you to
buy its system. So, the choice becomes a matter of cost versus functionality. The Digital Theater Group had already placed their bets on Toonz, so that immediately eliminated the Mac OS. The race would have dropped out Windows NT and left SGI IRIX as the winner, but Digital Video,
an Italian software subsidiary of Miscrosoft, had recently ported Softimage
Toonz from IRIX to NT. This let The Digital Theater Group stray from the historically expensive SGIs and invest in a more cost-effective NT machine.
A Gateway GP6 450MHz PC (DV#204) was purchased with a standard 12GB hard drive and 256MB RAM. A 20-inch Viewsonic 20G monitor (DV#205) was used as

the display. Not only was this a good move for running Toonz, it proved to
be a cost-saver with regard to the production software-Adobe Photoshop,
Premiere, and so on-because the IRIX versions of those packages, if
available at all, are more expensive than the NT versions. For the
peripherals and extras, Geoff attributes substantial cost-savings to online
shopping. Anything from Jaz drives to DLTs to tape stock was obtained
through online shopping at rates that are less than those offered by retail
vendors. Among the necessary equipment for backup and storage, they used a
Quantum DLT 4000 drive (DV#206) and an 18GB Quantum Atlas III SCSI drive
(DV#207) for temporary storage.

An additional and necessary piece of equipment was the scanner they used to
bring the animation drawings into the computer. Although tradi-tional
flatbed scanners could be used for the process, the producers decided to
invest in a Ricoh scanner specifically designed for animation. The decision
was twofold: first, the scan-ner would automatically feed the animation
paper and scan it, eliminating the task of manually switching out each
frame; and second, the scanner can be controlled through Toonz, which could
adjust the exposure levels accordingly and register each drawing according
to the peg holes at the bottom of each page. Again, The Digital Theater
Group was adamant about doing the job right and they spent the extra money
on the right scanner for the job. The money they spent on the right
equipment saved potentially hundreds of artist-hours in scanning alone.

In this sequence, Tallulah is drawn into her dressing room mirror by a ghost
as she prepares to go onstage.

Outside of the cost of equipment and supplies, an animation house has a
staff of artists and support people, whose salaries contribute to the
pri-mary cost of production. Now that the hard costs have been brought down
to reasonable numbers, the problem becomes choosing the people who are going
to help you. The Digital Theater Group was able to recruit over a hundred
talented people to assist with the project. Among those people were an art
director, composer, sound fx and Foley artists, voice talent, animators,
inbetweeners, DIPers, layout artists, visual effects artists, painters, and
a 3D artist. The producers knew that they had the right equipment, but they

weren't going to fool themselves into thinking that they could do it alone.
They were certainly capable, but they needed the production to be done the
right way-and the right way was finding the right people. This is the key for both large and small animation houses. So, how do you find those people,
and how do you get them to help you?

The first and foremost method of recruitment is having a project that people
will love and will want to work on. The project has to mean something to them, and they have to be able to take pride in working on it. Cynthia already had a reputation for amazing work, and she had developed a network
of talent from working in the animation industry. But more important, the story that they wanted to tell was moving, and the beauty with which it was
told convinced people to invest their time and talent.

This multiple-layer scene was created by applying transparency and blur effects in Toonz.

The Shadow of Doubt was cut on Adobe Premiere (DV#208) with a Pinnacle DC1000 capture card (DV#209), utilizing a 70GB Medea RAID for AV playback.
For the project, Premiere had all the necessary features that a nonlinear editor should have, and it had mature three-point editing, which is a standard for Avid, Media 100, Discreet edit, and other high-end NLEs. Premiere was used to tweak timing and pace-making sure that everything worked before committing to film. The Digital Theater Group cut at 24fps to
conform to film, but they used 3:2 pulldown to bring it to 29.97fps for video purposes. Ultimately, the team needed both frame rate versions, with
video used to present the piece before the final output to film took place.
After the film's release, Shadow will be run back through telecine and put
onto video.

The Shadow of Doubt was going to film as I wrote this. The fact that it was
going to film determined a number of factors in production. The first was the resolution of the frames. Normally the resolution of a film frame is 2K,
or approximately 2000 horizontal lines, which is approximately 9MB per frame. At five minutes, Shadow took up approximately 64GB. This is final output only, which doesn't include all the layers of characters (painted and
unpainted), the backgrounds, and the FX layers. The producers felt that

the
amount of data was going to be too much of a burden on the system and
opted
to go for 1K, or roughly half the size. The images would be scaled up on
the
film recorder. The scaling slightly softened the image, but The Digital
Theater Group-in the spirit of doing things the right way-shot out a
short
test to make sure that the scaling process didn't have a deleterious
effect
on the images. It didn't. In fact, they preferred the slightly softer
look
because it suited the dark jazz theme of the story. They proceeded with
production at 1K.

The waiter is yet another character designed by Cynthia Wells (in fact,
she
designed all the animated characters in The Shadow of Doubt). This
transitional scene in the storyline displays the very important painted
background. The producers felt that this background was crucial to the
overall look and artistic feel of the project. Donna Prince, the art
director, was going for a painted look. The backgrounds were hand drawn
and
painted, scanned at 400dpi, heavily manipulated in Adobe Photoshop, and
then
imported as a Targa file into the Softimage Toonz.

When discussing film-out, the actual cost of the process surprises most
people that I speak with. The going rate in the Los Angeles area for
recording digital images onto 35mm film runs about $2.75/frame. At
initial
glance, you may think that this doesn't sound so bad. Then you realize
that
the project has 7200 frames in it, and the cost is put into perspective.
However, as with all things in this industry, things can be negotiated.
And,
using the same method as the recruitment of talented artists, The Digital
Theater Group was able to convince a recording house that their project
was
worth investing in, and the price was haggled down to a range that would
be
more fitting for a small animation studio. I don't presume to say that
everyone will give you everything you need, but you'll be surprised at
what
you receive when you ask for it and have the right project behind you.

Shadow will be making its way into the festival circuit upon completion.
Other distribution channels that the producers investigated were the
Internet, film, and television markets. This project has shown that
high-end
animation can be produced by a small studio, with a small budget, on

computer systems that can compete against the more expensive gear used by larger studios. It also shows how talented people will band together to create something from nothing, based on the knowledge that their participation will help make something worth watching. The joy is in the accomplishment, and the accomplishment is made possible by tools that are affordable. Cynthia and Geoff Wells have shown us that creation is really only limited by your creativity.

Well I have officially retired my copy of Netscape 4.72 as of tonight.
I just finished installing iCab 2.0 and updating the bookmarks files.
This is a very cool browser now.
It supports all the plug-ins including Quicktime (yahoo).
The fully drag-and-droppable text has always been a winner, but with all
the new features and what
amazing speeeeeeeed, I am won over.

I tried Netscape 6 beta, yack droppings, yeuuuucchhhh.
Could anything be more obnoxious.
Gosh maybe they want you to BUY SOMETHING.

iCab now offers full imports of all bookmark files from Netscape or IE.

Speed, ram frugalness, and I really love the fact that you can set
animated GIFs to only run once.
Full cookie control, resumable downloads, and you gotta love that
downloads window.

No extra crap.
Just one kick ass browser, and not one......I repeat, not ONE.......
extension or library added to
my system folder.

Why can't the other guys do it this right.

Oh yeah, one more thing I love, unlike IE and Netscape, iCab renders the
banner ads LAST, not first
with a delay (for your reading enjoyment).

Just thought I would share my joy.

www.icab.de/

Go get it.

Netscape 6 sucks! I will switch over to IE 5 when I need to.
Actually, will make the switch when my field 1998 PB G3 is swapped out
for the PB G3 Pismo.

Power Mac Bests the Gigahertz PCs

Henry Norr Monday, April 17, 2000

During the past 18 months, while top PC processor speeds have jumped from 450 megahertz to a gigahertz, the PowerPC chip used in Apple Macintoshes has climbed only from 400 to 500 megahertz.

But the PowerPC has always been able to get more work done in each clock cycle than Intel and Advanced Micro Devices processors.

That's all the more true with the latest PowerPC, the G4, especially with programs updated to take advantage of its key innovation, a ``vector-processing unit'' Apple calls the Velocity Engine.

Still, running at half the clock speed of the competition is a significant handicap, and as I tested the performance of the new gigahertz PCs, I wasn't at all certain Apple's machines could keep up. So I set out to find out.

Unfortunately, none of the major benchmarks of real-world performance runs on both platforms, so I turned to Adobe Photoshop 5.5, a program available in virtually identical versions for Mac and Windows. It's not only a widely used application, but also a pretty good indicator of overall processor performance.

Using the same test file -- a 50- megabyte scanned image of Yosemite -- and an Adobe plug-in that tells Photoshop how to take advantage of the PowerPC G4's Velocity Engine, I clocked a series of seven processor-intensive operations -- the same ones I had earlier run on the PCs -- on a 450-megahertz Power Mac G4. (Apple announced a 500-megahertz version of the same machine in February, but I didn't have access to one of those.)

When I first ran the tests on the Power Mac, it ``only'' had the 128 megabytes of memory that comes standard with this model. In this configuration, it handily outperformed one of the gigahertz PCs, a Hewlett-Packard 1G with Intel Pentium III and 128 megabytes of RAM. The Mac beat the Pavilion on six of the seven tests; its total time for the whole sequence was 118 seconds, nearly a third faster than the 185 seconds the Pavilion required.

But the other gigahertz PC, Polywell Systems' Poly 800K7-1000 with an Athlon processor from Advanced Micro Devices, had done even better, finishing the sequence in just 82 seconds. The Poly, however, had a big advantage: 256 megabytes of memory. To level the playing field, I swiped a 128-megabyte memory module from the Gateway Select 1000, which was already idle because its screen had gone blank. I restarted the Mac, adjusted Photoshop's memory settings to use the additional RAM and tried the tests again.

This time, there was no ambiguity: the 450-megahertz Power Mac blew both gigahertz PCs out of the water, completing the seven-operation sequence in just 55 seconds. Whereas the Athlon-based Poly had scored about a third better than the Mac when the former had twice the memory, the Mac cut its time in half and finished a third ahead once the two systems were configured equally.

Applications differ, of course, and no doubt there are legitimate comparisons where the PCs would come out ahead. But in spite of Adobe's roots on the Mac, it can hardly be accused of optimizing its products only for Apple hardware -- at times in the past Photoshop has run better on the PC.

In short, Mac partisans have no reason to panic about the PowerPC's current clock-speed shortfall, and graphics professionals who rely on Apple have no reason, at least in terms of performance, to doubt their choice of platforms: The Mac's resounding victory in this particular test is strong evidence that the PowerPC remains more than competitive with the best Intel and AMD can produce.

For now, anyway.

I have...Dumbass!!! You see...Lots of firms have bought the avid
systems and used like 10% of the functionality and paid for the
remaining 90% that they did not use. Avid is in trouble with declining
sales, losses and upteenth restructuring in months. Lots of stations
are buying FCP solutions...

Twinkie.. it would be a good idea for you to learn the limitations of your knowledge.

Most people aren't about to shell out $30k for a system and use "like 10% of the functionality" twinkie. They buy Targa 1000 or Targa 2000 systems.. or they buy Radius Edit DV systems.. or they buy a Casablanca... or some other $5k system. OR they buy a mac and FCP.. or they buy a grey Imac DV-SE or whatever they're calling it.

I don't know or don't care about Avid's "declining sales," I haven't paid attention.. but Avid's "coffin" isn't any more occupied than Apple's, twinkie. Again, Avid's market has never been about how many systems they can sell to little Sinclap's to edit their video of their grammy and grammpy's.. they sell to people who MAKE MOVIES. Or do INDUSTRIAL VIDEO. Or edit TV COMMERCIALS. Most of the time, they're not shot on any DV format camera. To those people, FCP doesn't do jack. To these people, saving $30k doesn't mean JACK if they can't choose the codec they use, or if there isn't a fully genlocked, fully professional component I/O and fully balanced audio I/O available. To those people, saving $30k means nothing when they are making several hundred bucks and up an hour with a client breating over their shoulder backing up to a deadline 15 minutes away..

Again, exactly how many major movies.. hell, how many movies have you EVEN HEARD OF that were edited in FCP? That would be.. NONE! How many national and even regional commercials? I haven't heard of one..

FCP is a great program, don't get me wrong. Like I said, I use it and like it. But saying it's bringing about the demise Avid is.. well, just the kind of ill-informed, Press Release parroting, Steve Jobs butt kissing, market ignoring, reality distorting drivel that I expect from you, twinkie.

"Thinking Different" means not just parroting, twinkie. You forgot about the first part.. the "thinking" part.

I feel like Dikembe Mutumbo, watching your little wimpy 12 footer sail through the air.. reachin' up, and swattin' it up into the cheap seats. Get that shit out of here!! Come back when you got GAME.

:)

Not far away now.

Machines are being delivered to developers very soon, and after that they will go on sale en masse by late northern hemisphere summertime, if what Milan are saying is true.

Check it out at:

http://www.milan-computer.de/gb/news/news032000a.html

The strategy is an interesting one, but is certain to win some followers, especially those users who need simplicity and speed in what they do with their computer. Of course the enthusiasts among us will have a field day seeing how quick our software will run under the 060 system. MagiC Milan and Jinnee also will show Windows and Mac users alike just how small yet powerful an OS should be...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Most people will not due this today is correct and thats why Avid is in
trouble. New solutions that were announced at NAB for under 10 grand
fits nicely..

Oh PHuLEAze..Before FCP and the new toys at NAB, there was nothing
between the lowend and the highend range of products/prices...Now there
is...Thats why Avid is in decline..Even Robert Morgan states to the
fact...

> Again, exactly how many major movies.. hell, how many movies have you EVEN
> HEARD OF that were edited in FCP? That would be.. NONE! How many national
> and even regional commercials? I haven't heard of one..

The new Oxygen network uses mostly FCP systems(will be eliminating the
$100,000 Avid set up) and KCCI TV Des Moines uses FCP to name a few..

> FCP is a great program, don't get me wrong. Like I said, I use it and like

5332. (OT) Diablo II for Mac? The 'Clap Will have To Wait....

Newsgroup: comp.sys.atari.advocacy
Date: 2000-04-30 00:00:00 UTC
From: winguy@my-deja.com
Message-ID: <noone-C9930A.13200930042000@bigmomma.idirect.com>
Source record: 1797

Think DiabloII will be released at the same time as Windows as Mac gamers have believed for the last 2 years? Like the official FAQ, and that walking hemmoroid the 'Clap has suggested? Think different.

From Blizzard Press Relase at:
http://www.diabloii.net/pressdesk/blizpr29april2000.shtml

'Diablo II is being developed by the Blizzard North design team and is expected to release during the first half of this year in Windows® 95/98/2000/NT format. A Macintosh version of the game will be available during the third quarter 2000.'

Sorry Mac users. You get to wait again.

And the Stress Test signup begins Monday. Except for Mac users, of course.

Regards,

WinGuy

Fine..except for the "make money" part.

You keep waiting, I'll be here shooting and editing video, thank you.

> > Sure, for that level of videomaker.. I've never argued that, twinkie.
>
> Bingo! Avid is losing the slice of the pie..

Again, you prove yourself clueless. Avid has never had a big piece of the low end pie, twinkie. They have a huge piece of the high end pie.. and I don't think many hollywood studios are switching to FCP!!

"Uh, Mr. Lucas? I'm sorry, we've switched to Apple Final Cut Pro.. your editor, the one you hire out for thousands of dollars a day, is going to have to work on a new system today.. oh, I'm sorry, FCP doesn't support 3D rendering. Oh I'm sorry, what do you mean you shot this part on Digital S? FCP doesn't support that codec, and we'll have to go analog.."

LOL!

> > Once again, talking out of your asshole. Avid has a low end pro product..
> > called
> > Xpress. There have been a bunch of other Targa 1000 and Targa 2000 based

Prove it, twinkie.. don't just say I'm clueless, prove it.

> It's happening...Try the technology section on playboy.com...A famous
> director has begun making his first flick on digital video!
>

> http://playboy.com/digital/feature/timecode/
>
> And your were saying?

I'm at work right and and won't click that URL.. but what codec are they using? Is it Digital S? Are they editing on FCP?

"It" is happening, if the "it" you are referring to is digital video becoming more and more popular among both low and high end video productions. But, for the tenth time, the high end stuff isn't shot on mini DV, twinkie.. and if it isn't shot on a DV variant, there's no point in using FCP.

In case you don't realize it, there's a big difference between your $800 mini dv camcorder and a pro camcorder. Does the word "lenses" mean anything to you? How about "three CCD?" How about "locked audio?" How about "HD?" Only NOW does FCP even support 16:9 video!

> Of course, there are problems with those
> > G4s,
> > aren't there? Are you even aware of the problems Pro Tools users are
> > experiencing
> > with them? I didn't think so.
>
> What G4 problems?

Let's see.. MIDI over USB, no update to OMS, and the biggie.. you CAN'T use two separate video cards on an AGP G4 without getting PCI bus errors. Everyone in the business knows that except you.. but then again, you aren't in the business.. so why are you arguing with me?

> > Again, I think FCP is a good program, twinkie.. it works pretty well for a

> > of
> > Apple.. they are different, twinkie..
>
> Rev 2 most likely will be ten times more..The beginning of the end of
> the traditional tools...

Oh, twinkie.. I thought it was ALREADY the beginning of the end for Avid? Man, you are FUNNY!!

I don't deny that Avid has and will continue to change their business model due to changing technology.. but so has Apple, Microsoft, and every other tech company, twinkie. Avid has always had competition in the low end from Radius to Targa to Casablanca to Iomega to Apple.. there's nothing new there, except the technology is getting cheaper. Of course, so are Avid workstations. For people who need ROCK SOLID performance, for whom downtime is MONEY out of their pockets, a FCP based system just doesn't cut it.

You don't have to believe me.. why don't you go to a video lab and ask them about it?

> > You are clueless enough to not even
> > understand
> > the advantages of the product you are cheerleading. I hope other "apple
> > power reps"
> > are trained a little better..
>
> We are trained..Like the segment on FCP by the development folks..

I'm sure you are.. you're trained in FCP, but NOT in the workings in the market. I would not hesitate to ask you for FCP feature descriptions and benefits, I'm sure you're well versed in that (I would hope so).

But it doesn't do you a whole lot of good to pretend you know about something, when you obviously don't. KNOW what you know. KNOW what you don't. It's a valuable skill.

I don't buy from someone who is afraid to say "I don't know, I will check" instead of trying to guess. But you have to understand the limitations of your knowledge before you can do that.. you have to have enough self confidence in yourself to try that.. you have to have a little humility for that.

> >
> > LOL! Like I said, get that shit out of here..
>
> Are you afraid that you will be wrong?

Oh, I know I can be wrong.. I've been wrong before, and will be again. I certainly don't have any fear of YOU proving me wrong, though! LOL...

Anyway, twinkie, you forget that I'm in a no lose proposition here.. I win as the tools get cheaper, I win if Avid fails or doesn't, I win if apple drops FCP.. because, as you will soon learn when you get your Canon "out of the shop," it's not really the tools.. it's the knowledge of how to use those tools. How do you properly light? How do you get good audio? How do you edit dialog? How do you do dialog replacement? How do you do foley?

All the G4/FCP systems in the world aren't going to help you make good video until you know the above.

It's just like the pro audio industry, twinkie.. host based systems haven't made Pro Tools, Sonic, Sadie, Otari and above go away. What has happened is people who record in their home studios are now understanding the benefits of going to outside pro studios for certain parts.. and they are getting more work from people who screw things up at their home studio. They are understanding that you still have to know how to mic a drum kit.. you still need to have great microphones and the knowledge that goes with it. Digidesign has adjusted by bringing out a lower end system.. Avid has delivered a $10k turnkey DV system that it just a little more expensive than a FCP/G4 system by the time everything is added up.

Who will win? I don't know..

All your silly predictions are meaningless.. of course, so are mine, except that I, at least, realize it.

> > Your follow up shot has been slapped up to the cheap seats once again... bring it
> > on, but you might want to bring a friend with you, because you can't handle me one

> > on one..
>
> Yea right!

Don't look now.. but once again, you tried to bring the ball inside on me. This time, you didn't even get a chance to try a shot before I picked you clean, then slammed it over your head.. are you foolish enough to try again?

Sure, for that level of videomaker.. I've never argued that, twinkie.

> Oh PHuLEAze..Before FCP and the new toys at NAB, there was nothing
> between the lowend and the highend range of products/prices...Now there
> is...Thats why Avid is in decline..Even Robert Morgan states to the
> fact...

Once again, talking out of your asshole. Avid has a low end pro product.. called Xpress. There have been a bunch of other Targa 1000 and Targa 2000 based systems that do a lot for less money then the Xpress. You are so clueless, you don't even understand the advantage of FCP.. that is, for those who shoot DV, it allows for host based no loss capture and edit.. and the software is the best at its price point.. but it's designed for those who shoot DV.. not many pros do, twinkie.

Why do you insist upon make yourself look more and more moronic?

> The new Oxygen network uses mostly FCP systems(will be eliminating the
> $100,000 Avid set up) and KCCI TV Des Moines uses FCP to name a few..

MOVIES.. I said MOVIES. I don't deny that FCP is a good choice as an editor in any situation where they shoot DV.. unfortunately, movies aren't shot on DV, twinkie.

> > FCP is a great program, don't get me wrong. Like I said, I use it and like
> > it. But saying it's bringing about the demise Avid is.. well, just the kind

>
> Get use to it..Apple is selling lots of G4's with FCP systems..

Get used to your foolish statements? I am, believe me.

Again, I'm sure they're selling many, and I'm pleased, I like Apple (though I don't particularly like Apple evangelist parrots like yourself who state the party line by rote then say "think different."). Of course, there are problems with those G4s, aren't there? Are you even aware of the problems Pro Tools users are experiencing with them? I didn't think so.

Again, I think FCP is a good program, twinkie.. it works pretty well for a rev 1 program.. and is a good choice for many low end editors who shoot on DV. FCP is NOT bringing about the end of AVID any more than Linux is bringing about the end of Apple.. they are different, twinkie..

Of course, anyone with the least bit of understanding of the little details of the market understands that..

> > "Thinking Different" means not just parroting, twinkie. You forgot about the
> > first part.. the "thinking" part.
>
> You are suffering the 'think denial part'...

Right.. once again, you do an excellent job at pointing out the limitations of your knowledge far better than I could. You are clueless enough to not even understand the advantages of the product you are cheerleading. I hope other "apple power reps" are trained a little better..

THINK DIFFERENT than Steve Jobs, twinkie.

LOL! Like I said, get that shit out of here..

Your follow up shot has been slapped up to the cheap seats once again... bring it on, but you might want to bring a friend with you, because you can't handle me one on one..

The "oh-so happening" Amiga platform just died, along with its
last issue of Amiga Format. Most of the editorials and readers
comments go along the line of:

"Amiga changed hands so often that we might as well enjoy what's
already there and not hold our breath for anything new".

R.I.P.

5338. confirmed - Linux package for Milan II

Newsgroup: comp.sys.atari.advocacy
Date: 2000-05-02 00:00:00 UTC
From: Martin Graiter <graiter@starmail.com>
Message-ID: <noone-B950E1.17443102052000@bigmomma.idirect.com>
Source record: 1703

so that well-known Mac Idiot, the 'Clap, has been crowing that the
Milan II is vaporware.

well lookee here, here's news of a major new project that will bring
the strength of the Linux platform - and its many great applications
like Netscape and Corel Wordperfect - as an available bootable option.
And companies like SuSE don't develop for vaporware platforms.

The 'Clap is a disease - and the truth is the cure.....

: Well a friend of mine contacted Suse about this, better
: he contacted the right person there and the answer was
: that Suse is working on a 68040/68060 compilation, which
: can be used on the Amiga and Apple plaform, but they are
: going to compile a special Milan II version.

Excellent news! SuSE is my favourite Linux distribution
for the PC, structured, logical and comfortable. They're
also a *leading* Linux company, in the sense that they
develop drivers and add new system features no one else
has come up with before. Like support for more RAM etc.
For instance, they're the first company to offer it's
distriution on DVD. So instead of six CD:s containing SuSE
Linux, you only need one.

The six CD:s are filled with 1500 prgs, among them
heavyweighters like Netscape, office packs, WordPerfect
etc.

Despite all this it all costs you about the same as a mere
upgrade from MagiC 5 to 6.

This is indeed good news for the Milan!!! It means that
this bird will be able to surf the web and fly like all
the other winged birds out there. With doubled partitions
this means that you'd be able to run two or more OS:s,
just like any ordinary PC can. On the first partition:
SuSE Linux, on the second: MagiC or TOS 7 or whatever. So
the browser Messias we're all waiting for will be able to
relax and crawl real slow to it's far away destination
Javaland. Because we'd already be arrived there on the
other partition...

I've heard a rumor that the folks behind the Milan have
aquired the rights to the Centurbo board, and also to the
double CPU Phenix motherboard. Can we hope for a
continuation of these projects in rebadged form? A

Centurbo for the TT? A Centurbo with integrated SVGA card? Any comments?

Double MC68060:s (or double whatever CPU) requires much more of the OS than TOS or MagiC can provide for, but Linux is ready for up to 8 CPU:s (if I recall things right). At least on the Intel, Sparc and Alpha platforms.

MG

But folks were buying the highend stuff because the lowend stuff was
tooo lowend and there was nothing in the middle until now.. Avid
milked it all it's worth and did a dumbass thing by stick the middle
pinky at their mac customers after intel invested in the company. This
was going on when Jobs had begun the turnaround and decided not rest
it's fate in a key market in the hands of a skitzo vendor..The rest is
history..

Very True..That was covered in the video media production class. But
there are lots of creative types out there that can figure out unlike a
certain 'chunk's'...

Why wait? You can get a box to run Linux today? So you need Linux to run decent apps?

> The 'Clap is a disease - and the truth is the cure.....

Just stated a reason not to wait for vapor.

> : Well a friend of mine contacted Suse about this, better

I already have you some names, twinkie. I have a friend who has been making movies on a Targa 2000-based system for many years.. VERY mid priced. Are you familiar with the Radius Edit DV?

> > "Uh, Mr. Lucas? I'm sorry, we've switched to Apple Final Cut Pro.. your

Very good, twinkie..

> Pro DV Cameras begin at $2500 for a nice Sony one...Prices are
> falling...

OH MY GOD! There is NOBODY in the industry who would say an XL1 or DVX-1000 is "PRO." NOBODY!! You keep doing it again and again.. they are fine cameras, to be sure, for the price.. but NOT pro.

I know it's very painful for you to admit it, but you just don't understand the business.

> > > What G4 problems?

Give me his email addres and let me ask him.

Better yet, go here:
http://www.digidesign.com/ubb/Forum16/HTML/003225.html

..for a discussion on the problem, including a potential solution (a $700 dual monitor card).

Or here:

http://www.digidesign.com/ubb/Forum16/HTML/004153.html

..for a discussion on the problems with three monitors on an AGP G4, including an admission from Digi that "it doesn't look good."

All it takes is a little bit of research, twinkie, to prevent making yourself look more and more clueless.

> v 2 most likely will be ten times more..The beginning of the end of
> > > the traditional tools...
> >
> > Oh, twinkie.. I thought it was ALREADY the beginning of the end for Avid?
> > Man, you are
> > FUNNY!!
>
> Just wait and see!

Yep, I will.. it was, what, a year or so that FCP first shipped? Since then, how many motion pictures were shot on DV and edited on a FCP system? Er.. that would be none, right?

>
> > I don't deny that Avid has and will continue to change their business model

>
> Sure...

"Sure?!?" Does that mean you actually will do some research into the industry?

Come on twinkie.. at least respond to the point above. Do you even know what Radius' product is? Do you know what the Casablanca system is? Do you know what a Targa 2000 is?

> > I'm sure you are.. you're trained in FCP, but NOT in the workings in the

>
> You should try your own thoughts...

Again, twinkie, I KNOW what I don't know.. I DON'T make prognostications about Apple because I don't really know the computer market very well, relatively speaking. I don't make any predictions about Adobe Photoshop or Quark or Microsoft Front Page or Apple's stock prospects or the prospects of OSX or..?!? You get it yet?

Stick with what you know, really.. I'm sure there are some areas where you are quite knowledgeable.. this ain't one of them, twinkie!

> > I don't buy from someone who is afraid to say "I don't know, I will check"

Right.. so, again, I have nothing to be "scared" about.. I'm in a no lose situation. I don't care what tool I use..it's just a tool.. as long as it's stable, I'll use it..

> > All the G4/FCP systems in the world aren't going to help you make good video
> > until you
> > know the above.
>
> True...But there are alot of young creative types out there..

Yes there are.. and there will be some great work coming out on these cheaper systems. I've been excited about the digital revolution in audio and video for a long time.. even though there's more crap then ever before, the cheap technology also gives more people the opportunity to do something great.

BUT..

Do you really think these young people with great ideas will stick with FCP when they get more money? DO you really?

To say FCP is bringing about the demise of Avid is ill-informed, foolish, Steve Jobs hyperbole that has no basis in reality.

You COULD make the argument that the digital revolution is causing Avid to rework their strategy.. of course, it's causing ALL players in the market to do that, but at least that would have some truth to it.

So really.. to put it honestly, your ridiculous parroting of the Apple PR "reality distortion" line just serves to make you sound like a stooge. I really believe you're smarter than that.. against all proof, maybe, but I believe it. Act like it..

> Very True..That was covered in the video media production class. But

>
> The tone in your post does not indicate this..

Right.. but if you're going to invest in a company, would you listen to your grammy who spends 15 minutes a day on etrade and does no research over someone who spends full-time looking, researching, checking out the market? Wouldn't it seem rather ridiculous to hear your grammy comment about something she knows nothing about?

Your comments are so far off and display such an incredible lack of understanding of the market, yet spoken with such certainty, that they need to be debunked clearly and often. This is not about any 'tone' of my voice.. YOU set the tone with your ridiculous post. Do I need to repost it? Oh what the hell, let's just look at the headline of this thread:

"The new products with the PM G4 and final Cut Pro could be the final nail in Avid's coffin.."

Is that clear enough for you? WHO among us has actually admitted their limitations in this thread? Me. Who is clear about the reach of their knowledge? Me. You've displayed zero understanding of the limits of your knowledge. Zero.

> > Don't look now.. but once again, you tried to bring the ball inside on me.
> > This time,
> > you didn't even get a chance to try a shot before I picked you clean, then slammed it

>
> Than why are you sweating?

Because I'm laughing so hard, I can't believe you would try yet AGAIN to score on me. As a matter of fact, I'm laughing so hard I've gone into convulsions, and I'm sweating profusely.. yet even through the convulsions, I'm STILL able to stick my arm up and grab the rebound on your badly missed shot.

The "oh-so happening" Amiga platform just died, along with its
last issue of Amiga Format. Most of the editorials and readers
comments go along the line of:

"Amiga changed hands so often that we might as well enjoy what's
already there and not hold our breath for anything new".

R.I.P.

Can't say that I've seen an Atari mag on the shelves for several years, but
then the Atari platform died some time ago didn't it.

There are still other Amiga mags, including one new one.

And I guess you haven't heard of the new developer machine announced just
recently.

No, you just post irrelevant crap in this Atari newsgroup and then turn
around and slam others for doing the same.

Regards,

Clockmeister.

Hi Darklord, good to see you're still around to provide some clever thoughts
;-)

AC jumped on the Linux bandwagon, and tried to lure the Amigans to the dark
side where men bald quickly.

BeOS would be a natural progression from AmigaOS, being both user friendly
and configurable. Linux is like taking two steps back to take one step
forward... plenty configurable, but user friendliness goes out the window.

Regards,

Clockmeister.

Unix has always had the potential of being quite userfriendly.
What hostility it has mostly comes from running on PC hardware
of which Linux supports more than BeOS.

It's trivial to be 'easy' when you don't support ISA or VL.

Outside of professional music/audio you actually see BeOS users
whining for apps, quite often Linux apps.

QNX is a better end-user-media-OS right now. QNX actually bothered
to licence the technology for DVD movie decode. They have flash and
realaudio NOW (as does Linux) and the upcoming freebie consumer
desktop distro has most of the common GNU tools and a version of
Quake III (which hasn't come out for BeOS yet, but has come out
for MacOS and Linux).

...and the ease of BeOS is overhyped. It has it's own usability
problems.

The way things are going, QNX will get a version of Quicktime 4
before BeOS does.

I've read in several places that BeOS takes the better ideas from
AmigaOS and TOS and takes them one step further. I agree.

Be is a 'media OS'.

However, Be is lacking (relative to a volunteer projects: Linux,
FreeBSD) in the area of media device support and media format
```

support.

BeOS has some major holes. So does Linux and FreeBSD. Although
ironically Linux and FreeBSD have less.

BeOS excels more in terms of the more vertical rather than as
a general purpose desktop machine.

>
>> It's trivial to be 'easy' when you don't support ISA or VL.
>
>ISA and VL are dead.

They aren't quite dead yet. Even in the retail channel for
NEW products, ISA slots are still being perpetuated. This
isn't even getting into legacy hardware. Furthermore, the
lesser hardware support makes replacing such legacy bits of
hardware more expensive.

>
>> Outside of professional music/audio you actually see BeOS users

...they clamour for some of those as well.

Windows APPS aren't usually the problem: the OS usually is.

Most application developers just can't drag themselves away from
the Win32 gravy train. (Hurts all the other platforms) What
interesting commercial apps that Be does have have come with
considerable marketing effort on the part of Be.

Modem's don't like lots of OSes. Due to the 'no-isa' policy,
quite a few are quite unavailable to Be. Others require
device drivers.

I'm not sure what other problems you could find to have with
the few that remain after you eliminate ISA and winmodems.

Proxy settings are application specific and don't tend to
vary from platform to platform but rather app to app.

>
>> The way things are going, QNX will get a version of Quicktime 4
>> before BeOS does.
>>
>
>Be needs to do more to help that situation.

As a commercial competitor with limited marketshare, limited mindshare
and no active userbase to 'pitch in', BeOS is in a disadvantaged
position.

BeOS is lacking in hardware and software support, that is true, however,
what is available is generally pretty good (except for the news clients :-(

> It's trivial to be 'easy' when you don't support ISA or VL.

ISA and VL are dead.

> Outside of professional music/audio you actually see BeOS users
> whining for apps, quite often Linux apps.

Naturally. Who would want to see Windows apps ported, it's not in the spitit
of using an alternative OS.

For fun, of course. You don't run a UNIX permanently on an amiga, that's
a machine with soul, and the soul is the AmigaOS.
Nevertheless, why buy a Milan for running Linux? If you're going to run
Linux, there are far better platforms. Just about every platform, as a
matter of fact. You're bound to get a more capable Sun or DEC at a lower
price.

Just 1 is still enough to keep the hell alive. If it's your last slot,
then you pretty much have to use it. Lord knows I'd rather use PCI
ANYthing in place of that one last, lingering PCI slot.

Besides, there are still machines that are plenty capable that aren't
necessarily 'brand new' out there.

[deletia]

Funny, it could handle mine. Didn't have any problems with the
internal hardware modems either. You should be able to push
characters out the com port with AT commands as if it were an ST.

A 'mediaOS' should certainly be able to handle the predominant
media types found on the web. This includes QT4. A 'mediaOS'
should also support software DVD decode.

Considering that 'mpegs running on the sides of a cube' demo,
these sorts of feature should be a no-brainer.

Old, outdated PC's. Most new motherboards have either no, or only 1 ISA
slot. ISA may not be dead in a legacy sense, but as far as today's
technology goes, ISA is finished.

BeOS was inspired by AmigaOS, and hence an Amiga window theme is included.
(although hidden in PE5).
TOS... dunno.

Regards,

Clockmeister.

I still have a full head of hair, and I intend to hang on to it as long as I
can ;-)

You're brother is right ;-)

Regards,

Clockmeister.

If anything, he likely said it in GERMAN.

:>While ISA should be dead, I've got a heap of them here, and they're doing
:>quite fine, too. I've even got a friend who's using an ISA ehernet card in
:>his Amiga 4000, and we're trying to get some 8-bit ISA NICs running on our
:>Amiga 2000 stack at the computer club.

: In presume those Amigas have a bridgeboard or goldengate device to allow
: access to the motherboard ISA slots then, considering that the ISA slots
: are only powered by the PSU but otherwise aren't electronically connected to
: the Amiga in any way.

That's true. My friend runs a Golden Gate II+ in his A4000, and we're
fiddling with A2088 PC emulators at the club. A really odd solution. In
order to run a NIC, you need to run MS-DOS on the emulator, then run a
packet driver, then server software which ties into the Hydra device for
